AUSTRALIAN BUREAU OF STATISTICS

CATALOGUE NO. 1307.4

R-Commonwealth of Australia 1996

Produced by the Australian Government Publishing Service

PREFACE

South Australian Economic Indicators is a monthly publication which contains the latest available data at the time of preparation for a range of statistical series that have been identified as indicators of economic activity in this State. In a number of cases the figures presented are preliminary and subject to revision in subsequent issues.

Written and graphic commentary have been included for many of the selected series and analysis has been augmented with the calculation of the percentage change from the previous reference period together with the presentation of comparative Australian data.

Time series information has been included to provide a historical perspective on many of the selected indicators. Future issues may be expanded to include further historical data in response to expressed user needs. This product is under continuous review and any suggestions for enhancement will be welcomed.

More detailed information on each series, including explanatory and technical notes, can be obtained from other Australian Bureau of Statistics publications or alternative data sources. To assist those seeking further information a source publication for each of the series has been documented in the statistical summary.

This issue includes a special article entitled *Seasonal and Trading Day Influences on Retail Turnover*. Future issues will contain further articles on statistical topics which concentrate on longer term trends or other issues pertinent to the South Australian economy.

If you have any inquiries concerning this publication please contact the editor, John Callinan, telephone (08) 8237–7307. All requests for statistical information should be directed to the ABS Information Service, GPO Box 2272, Adelaide SA 5001, telephone (08) 8237 7100.

REVIEW

Overview

- In June 1996 the total value of merchandise exports was \$333.2 million, a 16.0% decrease on May.
- Total merchandise exports for 1995-96 were \$4,480.6 million an increase of 17.0% on the previous year due mainly to an increase in the value of exports from the agriculture sector.
- Exports to China increased by 64.6% in 1995-96 to \$292.3 million.
- The trend estimate of retail turnover continues to increase with a risc of 0.8% in June 1996.
- The trend estimate for new motor vehicle registrations in June 1996 decreased 0.6%.
- The trend estimate for private sector house approvals has remained flat over the last few months.
- The value of non-residential building approved was \$26.9 million in June 1996, a return to normal levels after the previous record May figure which can be attributed to one large building project.
- The indexes for House Building Materials and Non-house Building Materials showed no movement in June 1996.
- The trend estimate of employed persons has been increasing since January 1996 with the July 1996 estimate 1.1% higher than the level of 12 months ago.
- The trend unemployment rate has decreased from 9.8% in July 1995 to 9.2% in July 1996.
- There were 10,600 working days lost through industrial disputes during May 1996, this represented 36.1% of the days lost in the past 12 months.
- Average weekly ordinary time earnings of full-time adult employees in South Australia was \$633.80 in May 1996 an increase of 1.2% on February 1996.
- The June trend estimate for the value of owner-occupied housing commitments decreased 3.4% to \$229.8 million.

NOTE: Deficiencies in the data sources used to estimate gross operating surplus for recent quarters may at times lead to the current price estimates of gross state product GSP(I) eing under or over stated for particular States. Consequently, the measured growth rate for constant price GSP(I) for those States will also be affected.

The constant price series for gross sate product (GSP) have been labelled as 'experimental'. Users are cautioned that these estimates are derived indirectly by calculating a deflator from the expenditure components. It is emphasised that, at times, movements that can not be fully explained may be introduced into the constant price GSP(I) series through the use of this proxy deflator.

Trend Estimates (Current Prices)

Gross state product (GSP) grew 1.5% in the March quarter compared with the national average of 1.6%. This is the third consecutive quarter in which the rise in GSP has closely followed the national average.

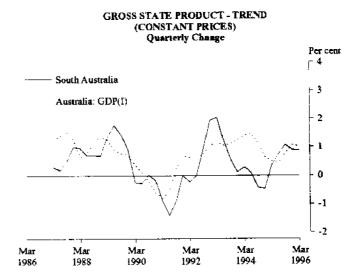

Wages, salaries and supplements grew 1.5% in the March quarter (1.6% nationally). Growth has been below the national rate since the December quarter 1993.

Gross operating surplus (GOS) grew by 1.5% in the March quarter, the highest growth rate of any State. Growth in GOS has been above the national rate for the past 3 quarters.

Growth in indirect taxes less subsidies has been significantly below the national rate for the past 2 quarters, with the March quarter increasing by 1.6% compared with the national rate of 2.8%.

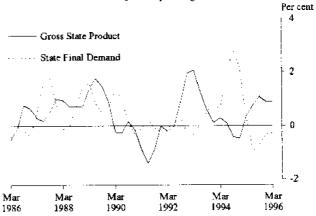

Trend Estimates (Constant Prices)

The experimental GSP at constant prices grew 0.9% in the March quarter, and is 3.7% above the March quarter 1995.

For the fourth consecutive quarter, GSP has grown at a faster rate than State final demand.

South Australia was the only State to show a decline (-0.3%) in final demand in the March quarter, the fourth consecutive quarter of negative growth. State final demand is now 2.3% below the March quarter 1995.

Private final consumption expenditure decreased by 0.1% in the March quarter, considerably below the strong growth of 1.7% recorded in the March quarter 1995. South Australia was the only State to record a decline in private final consumption expenditure.

Private gross fixed capital expenditure decreased by 0.8% in the March quarter. The decline in expenditure on dwellings more than offset increases in expenditure on equipment and non-dwelling construction.

Public final demand declined 0.5% in the March quarter due mainly to government final consumption expenditure which fell for the third consecutive quarter.

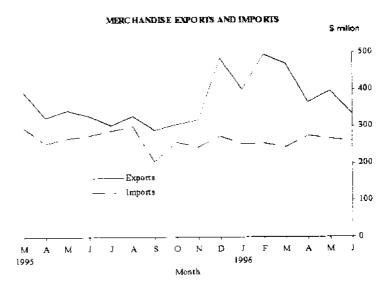

International Accounts

Exports

In June 1996 the total value of merchandise exports was \$333.2 million, a 16.0% decrease on May 1996 but still 1.7% more than June 1995.

For 1995-96 merchandise exports were \$4,480.6 million, a 17.0% increase on the previous year. Cereal and cereal preparations recorded the largest increase \$451.8 million or 173.1%. Other commodity groups that showed increases were wine, up 26.0%, machinery, up 18.0% and metal manufactures, up 6.0%. Exports of road vehicles, parts and accessories and pertoleum and petroleum products and wool and sheepskins decreased by 23.6%, 22.7% and 21.0% respectively.

One of the major regions for exports is the Middle East, with exports to this region increasing by 184.4% on 1994-95. Exports to China increased by 64.3% in 1995-96 to \$292.3 million. Japan remained our biggest buyer of goods with purchases worth \$674.4 million in 1995-96.

Imports

The value of merchandise imports for June 1996 was \$260.9 million, a decrease of 2.0% on the previous month and a decrease of 2.5% on May 1995. During 1995-96, \$3,113.8 million worth of merchandise were reported as being released from Customs control in South Australia, an increase of 0.5% on 1994-95.

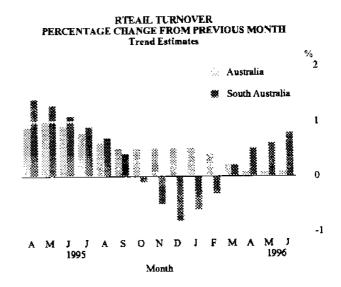

Consumption and Investment

Retail Turnover

The trend estimate of retail turnover in South Australia has shown growth in recent months with June 1996 showing a 0.8% increase in the rate from the previous month. Growth in the Australian trend series has slowed in recent months to 0.1%.

Over the past three months the trend estimate for South Australia has increased by \$14.9 million. Of this amount, \$13.2 million was attributable to the food retailing group and \$9.2 million to the hospitality and services group. These increases were partly offset by a \$4.6 million decrease in the clothing and soft good group.

The seasonally adjusted estimate of retail turnover in June 1996 increased 0.1%. In original terms, South Australian retail turnover was \$726.6 million, an increase of 1.3% on June 1995.

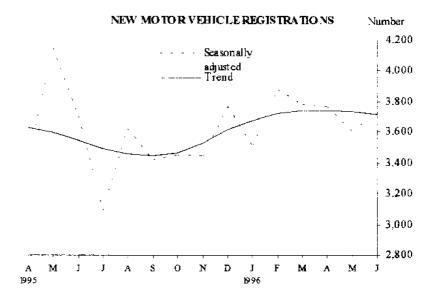

New Motor Vehicle Registrations

The South Australian trend estimate for new motor vehicle registrations in June 1996 decreased 0.6%. The seasonally adjusted estimate for June increased by 3.7% from May and by 0.9% from June 1995.

In original terms there were 3,932 new motor vehicles registered in June, an increase of 3.7% from May but a decrease of 6.0% on June 1995. For new passenger vehicles, the leading makes registered in June were Holden (711 vehicles), Ford (631), Toyota (477), Mitsubishi (356) and Hyundai (219).

In the 12 months to June 1996 there were 42,895 new motor vehicle registered, 0.8% increase on the previous year.

Tourist Accommodation

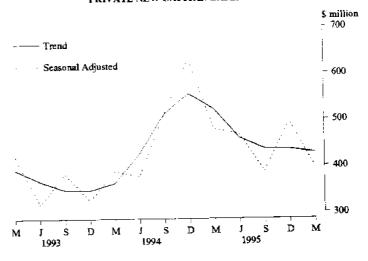

When the March quarter 1996 is compared with the March quarter 1995, caravan parks capacity increased by 0.2% from 24,351 to 24,388 powered and unpowered sites, on-site vans and cabins. The number of site nights occupied decreased by 0.8% from 669,770 to 664,554 and the site occupancy rate fell from 30.6% to 30.0%. Accommodation takings fell by 0.8%, from \$8.6 million to \$8.5 million, with the average takings per site night occupied remaining static at \$12.80.

Bedspaces available in visitor hostels increased by 9.6% with demand relatively unchanged, resulting in a decrease of 3.2% in the bed occupancy rate. Accomodation takings increased 14.1%, from \$688,000 to \$785,000.

Private New Capital Expenditure

The trend estimate (in current prices) for private new capital expenditure in South Australia for the March quarter 1996 was \$429 million. The decrease of 1.6% from the previous quarter is a continuation of trend decline which commenced in March quarter 1995. The Australian figure rose by 1.9%. The South Australian total for the quarter now represents 4.6% of the Australian figure.

PRIVATE NEW CAPITAL EXPENDITURE

Private new capital expenditure in original terms for the March quarter 1996 was \$375 million, a decrease of 30.0% from the December quarter 1995. Buildings and structures accounted for \$72 million, and equipment, plant and machinery \$304 million. Expenditure for the 12 months to March 1996 fell by 12.2% with the Australian figure rising by 9.4%.

Production

Dwelling Approvals

The trend estimate for private sector house approvals has remained flat over the last few months.

The trend estimate for the total number of dwelling units approved in South Australia resumed its downward movement for June falling 1.1%.

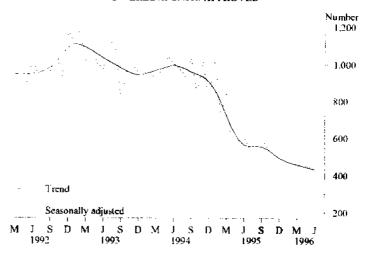

The number of dwelling units approved in June 1996, in original terms was 436, a 13.7% decrease on the previous month.

In original terms, South Australia accounted for 4.5% of the total dwelling units approved in Australia for June 1996.

The Australian trend estimate for the total number of dwelling units approved in June was 0.3% lower than for May, and 11.2% lower than the previous years estimate.

The total number of dwelling units approved in Australia for June 1996 fell to 9,666, down 20.8% from the June 1995 figure of 12,206.

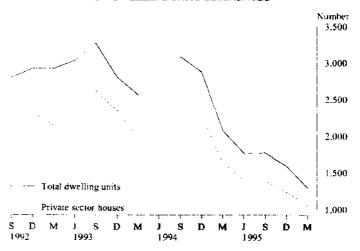

Dwelling Commencements

In South Australia the number of new dwelling units commenced continued to fall during the March quarter 1996 to 1,284, a decrease of 17.6% on the previous quarter. This compares with a fall of 6.8% nationally. When compared with the March quarter 1995 there was a decrease of 37.8% for South Australia and 20.8% nationally. Expressed as a proportion of the national total, the number of commencements in South Australia was 4.6% compared with 5.2% last quarter and 5.8% for the March quarter 1995.

NEW DWELLING UNITS COMMENCED

Value of Non-residential Building Approvals The value of non-residential building approved for South Australia in June was \$26.9 million. Although the June value is a substantial fall from the May value, this is a return to a more comparable figure with earlier months. (The previous months high was attributed to one particular large building project.)

In June 1996, South Australia contributed 3.2% towards the total value of Australian non-residential building approvals of \$849.7 million.

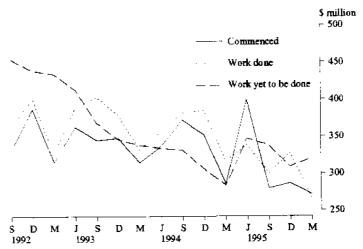

Value of Total Building Activity

The total value of building work commenced in South Australia during the March quarter 1996 fell 5.4% from the previous quarter to \$271.9 million. Compared with the March quarter 1995, South Australia had a 5.1% decrease in building commencements while the corresponding national movement was a 11.3% decrease. The South Australian share of the national total of building commencements was 4.5% for the March quarter.

The total value of building work done during the March quarter 1996 fell by 18.8% to \$266.1 million with a similar decrease (18.3%) nationally. Compared with the March quarter 1995, South Australia had a 16.2% decrease in the value of total building work done while the corresponding national movement was a 8.8% decrease.

The total value of building work yet to be done in South Australia rose by 3.8% for the March quarter 1996. The corresponding national figure rose by 5.7% to \$8,793.4 million. Expressed as a proportion of the national total, the total value of building work yet to be done in South Australia was 3.6% for the March quarter.

VALUE OF BUILDING ACTIVITY

Value of Engineering Construction

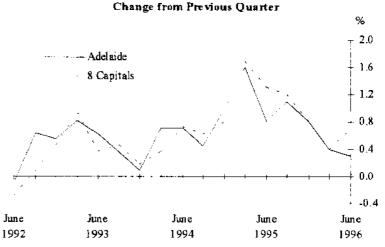

In the March quarter 1996 the value of engineering construction work done in South Australia increased by 17.9% to \$198.8 million compared with a decrease of 8.6% nationally. South Australia had a 5.8% share of the national total of \$3,446.2 million. The value of work commenced during the quarter more than doubled to \$307.8 million for South Australia with the national figure increasing by 50.1%. The State's proportion of national commencements was 6.8%.

Prices

Consumer Price Index

For the June quarter 1996 the Consumer Price Index (all groups) increased 0.3% for Adelaide compared with an increase of 0.7% for the 8 capital cities. The annual increase was 2.7% for Adelaide and 3.1% for the 8 capital cities.

CONSUMER PRICE INDEX

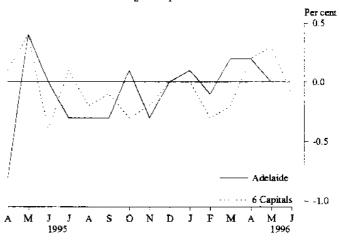

House Building Materials

The Price Index of Materials Used in House Building showed no movement in Adelaide for the month of June 1996. The weighted average for the 6 State capitals fell by 0.1% for the month of June.

For the 12 months to June 1996, the Index fell by 0.6% for Adelaide, compared with a fall of 0.7% for the weighted average of the 6 State capitals.

MATERIALS USED IN HOUSE BUILDING Change from previous month

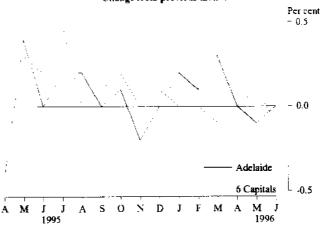

Non-house Building Materials

Adelaide showed no change in the Price Index of Materials Used in Building Other than House Building for the month of June. An increase in the price of paint and non-ferrous pipes and fittings was off set by small decreases in the price of ready-mix concrete and clay bricks. The Index fell by 0.1% for the weighted average of the 6 State capitals.

The Index shows a rise of 0.7% in Adelaide for the 12 months to June 1996, compared with a rise of 0.8% for the weighted average of the 6 State capitals.

MATERIALS USED IN BUILDING OTHER THAN HOUSE BUILDING Change from previous month

House Prices

The price index of established houses and project homes in Adelaide increased 0.2% and 0.4% respectively during the March quarter 1996. Nationally, over the same period prices for established houses decreased by 0.2% and project homes increased by 0.1%.

In Adelaide in the year to March quarter 1996, the price index for established houses decreased by 3.5% and project homes by 1.1%. Nationally, for the twelve month period, established house prices recorded a 0.9% decrease while project homes rose by 1.4%.

Labour Force and Demography

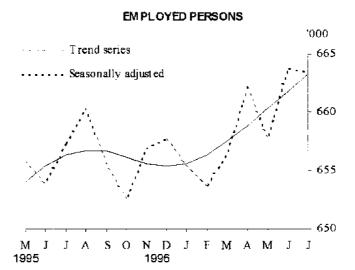

Population

At 31 December 1995 the estimated resident population of South Australia was 1,475,860. This was an increase of 0.08% (1,186) persons from the September quarter, which was below the national increase of 0.3%. The continuing low growth rate for South Australia is attributable to a net outflow in interstate migration of 1,512 persons which was offset by a net inflow of overseas migration of 946 persons and a natural increase of 1,752.

Employment

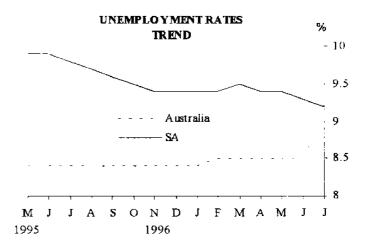

The trend estimate of employed persons in South Australia has been increasing since January 1996. The July 1996 estimate (663,200) is 1.1% higher than the level of 12 months ago.

In July 1996, the trend estimate of employed persons in Australia was 8,330,600. This was 0.9% higher than the level for July 1995. Over the past year, full-time and part-time employment have increased by 0.5% and 2.0% respectively.

Unemployment

The trend unemployment rate for South Australia has decreased from 9.8% in July 1995 to 9.2% in July 1996. Over the same period, the trend unemployment rate for males has decreased from 10.9% to 9.8%, while the rate for females has decreased from 8.5% to 8.4%.

In the six months to July 1996, the trend estimate of the unemployment rate in Australia has remained flat at 8.5%.

Overtime

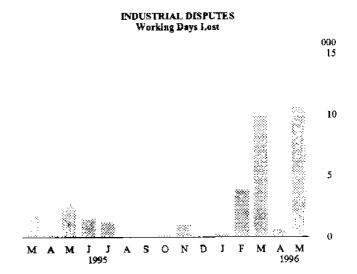

The proportion of employees who worked overtime in South Australia in May 1996 was 16.1%. This was slightly lower than the May 1995 level of 16.7%.

An average of 6.6 overtime hours per week were worked by employees receiving overtime in South Australia in May 1996. This was lower than the corresponding national level of 7.3 hours.

Industrial Disputes

There were 10,600 working days lost through industrial disputes in South Australia during May 1996. This comprised 6.5% of the national total (164,000 working days lost).

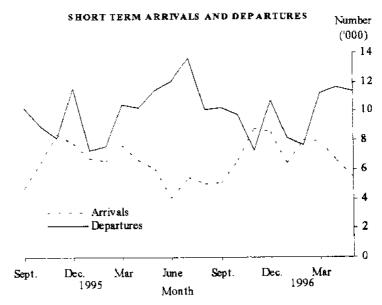

In the 12 months to May 1996, 29,400 working days had been lost due to industrial disputes in South Australia, with 21,200 working days occurring in the last 3 months.

Short term Overseas Visitor Arrivals Arrivals of short term visitors to South Australia fell by 17.0% to 5,500 for the month of May 1996, and were 9.3% fewer than the number which arrived in May 1995. The Australian figures showed there were 5.9% fewer visitors in May 1996 compared with May 1995.

Short term Resident Departures

There was an decrease of 2.1% in the number of short term departures of South Australian residents in May 1996 when compared with April 1996 and a 0.8% fall on May 1995. The Australian figure showed an increase of 7.0% since May 1995.

Incomes

Average Weekly Earnings

The trend estimate of average weekly ordinary time earnings of full-time adult employees in South Australia increased from \$625.40 in February 1996 to \$634.00 in May 1996. Male full-time ordinary time earnings rose from \$658.90 in February 1996 to \$671.70 in May 1996. Over the same period, the change for females was less pronounced, increasing from \$554.90 to \$555.20.

Between February 1996 and May 1996, the trend estimate of average weekly total earnings of all employees in South Australia increased from \$522.40 to \$531.50.

Since it is an average of earnings across all employees, changes in average weekly earnings may occur through changes in employment as well as changes in pay levels.

Award Rates of Pay

Over the 12 months to June 1996, the weekly award rates of pay index for full-time employees in South Australia increased by 1.3%.

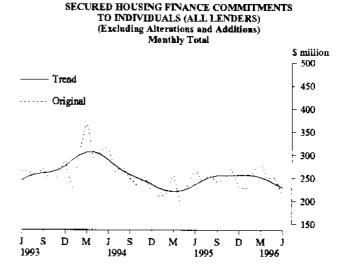

For full-time adult male employees, the largest annual movement of the index occurred in the electricity, gas and water supply industry division, with an increase of 3.4%.

For full-time adult female employees, the largest annual movement of the index occurred in the public administration and defence industry division, with an increase of 2.3%.

Financial Markets

Housing Finance

The June trend estimate for the value of owner-occupied housing commitments was \$229.8 million, down 3.4% compared with May 1996 and 2.5% lower than June 1995. This compares with the national decrease of 1.5% for the month, and a 4.3% increase for the year.

This is the first month since September 1995 that total housing finance commitments (original figures including alterations and additions) have been below the corresponding month of the previous year. The main contributor to the fall was commitments for purchase of established dwellings which decreased by \$29.4 million (17.5%) to \$138.3 million. Significant falls were also recorded for newly erected dwellings (down 39.3%) and refinancing (down 13.3%).

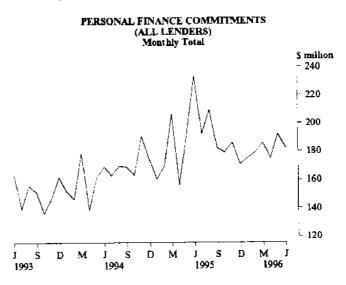

Finance commitments for construction of dwellings increased marginally for the second consecutive month (up 2.2% in June to \$27.0 million) but was 13.5% below June 1995. Alterations and additions increased by 37.9% to \$26.1 million, which represented 10.9% of total housing commitments compared with the national proportion of 7.8%.

Personal Finance

During the month total personal finance commitments decreased 5.4% to \$182.0 million, 22.1% lower than June 1995. The national decreases were 6.4% and 8.7% respectively.

Fixed loan commitments decreased 8.3% to \$117.3 million, 10.2% below June 1995. Commitments for new motor cars and station wagons increased 3.9% during the month while used passenger vehicles decreased 6.7%. Both categories were significantly below the previous June. Refinancing, the second biggest category, decreased 21.2% falling from the very high level of the previous four months.

Revolving credit facilities increased 0.3% to \$64.7 million during the month, 37.1% below the record figure in June 1995. Secured commitments under revolving credit facilities decreased 2.4% to \$20.5 million, 31.6% below the previous June. Unsecured increased 1.7% to \$44.2 million, 39.4% below June 1995.

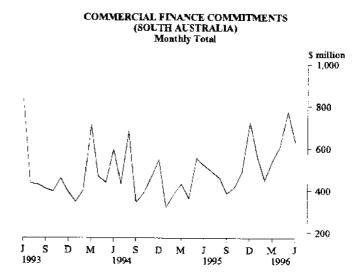

Commercial Finance

Total commitments decreased by 18.9% to \$627.7 million in June. For the past 10 months commercial finance commitments have been significantly above the corresponding months of the previous year. Nationally total commercial commitments increased by 13.1% during the month and 20.9% over the year.

The main decrease was in revolving credit facilities for public administration down by \$176.0 million from the exceptionally high figure in May. All the other categories had large falls except construction, community services and retail trade. Total revolving credit facilities dropped by 59.3% for the month and although 6.6% above June 1995 was 2.7% of the Australian total.

Commitments under fixed loan facilities increased 36.3% to \$445.8 million during June, 28.5% above June 1995. The main increase was for recreation, personal and other services (up \$71.6 million). Agriculture, forestry, fishing and hunting dropped by 9.0% from the record May figure. Manufacturing, construction and wholesale trade also had significant falls.

Lease Finance

The value of goods under new finance lease commitments reached \$31.2 million in June, up 25.8% compared with May but 1.8% below June 1995. The South Australian proportion of the national figure remains low at 3.6%.

Motor cars and station wagons not subject to depreciation increased by 21.4% to \$6.4 million for new vehicles and by 34.4% to \$3.9 million for used vehicles. Commitments for motor cars and station wagons subject to depreciation decreased 10.6% for new vehicles and 33.3% for used vehicles, both approximately half of the previous June figures.

All categories of trucks, trailers, buses, coaches and other transport equipment had significant increases with commitments for new heavy trucks at \$2.1 million, the highest since August 1994. The other major increases were for agricultural machinery and equipment, and manufacturing equipment both more than double the previous month. Commitments for construction and earthmoving equipment decreased 69.0% after the high May figure.

Forward Outlook

Composite Leading Indicator

The Composite Leading Indicator (CLI) is a single time series produced by aggregating eight individual economic indicators, and has been developed by the ABS as an experimental series to supplement existing forms of economic analysis and modelling.

The CLI summarises the early signals contained in a selection of economic indicators and is designed to assist the detection of turning points between successive expansions and slow downs of economic activity as measured by constant price GDP(A). It does not attempt to forecast the level of economic activity.

In the March quarter 1996:

- the experimental CLI rose 0.22%, following a 0.07% rise in the December quarter 1995.
- The CLI is now showing a trough at the September quarter 1995.

The quarterly data are released in more detail in the Australian Economic Indicators (1350.0). The CLI was the topic of the Focus article in the September 1993 edition of South Australian Economic Indicators (1307.4).

Australian Business Expectations Surveys of business expectations have been available to decision makers for a number of years from several sources. These surveys provided qualitative indicators in the form of the net proportion of businesses expecting a rise or fall in future business conditions. Since the December quarter 1993, the ABS has been compiling a quantitative indicator of business expectations in the form of an expected weighted aggregate change in a range of economic variables. These data are available on a quarterly basis in Australian Business Expectations (5250.0).

AUSTRALIAN BUSINESS EXPECTATIONS SOUTH AUSTRALIA AND AUSTRALIA SALES OF GOODS AND SERVICES EXPECTED PERCENTAGE AGGREGATE CHANGE

	Short to	em	Medium te	em

Reference Period	March 1996 and June 1996	June 1996 and Sep. 1996	March 1996 and March 1997	June 1996 and June 1997			
	%	%	%	96			
South Australia	1.5	0.3	3.6	2.3			
Australia	2.3	1.6	4.1	3.6			

Short term

Businesses in South Australia expect a rise of 0.3% sales of goods and services in the September quarter 1996 compared with the June quarter while the national expectation was a 1.6% increase.

Medium term

Businesses in South Australia expect sales of goods and services in the June quarter 1997 to be 2.3% above June quarter 1996. Australia wide the expectation was for 3.6% growth.

FOCUS

Seasonal and Trading Day Influences on Retail Turnover

This article was contributed by Jeff Cannon, Australian Bureau of Statistics, Canberra

Introduction

There have been substantial changes in retail trading over recent years. Some of the more notable changes are:

- Saturday afternoon and Sunday trading;
- night trading; and
- trading on public holidays.

Changing pattern of daily retail sales, especially increased retail activity on weekends, is a topical issue which has implications for the seasonal analysis of the monthly retail turnover figures published in *Retail Trade*, *Australia (8501.0)*. This article explains how the ABS's seasonal adjustment procedures deal with changing `trading day' patterns, and includes a brief review of the seasonal adjustment process used. Extracting the trading day effects requires that other monthly seasonal effects be estimated and removed from the data. Results show that there have been notable changes in the trading day effect for retail turnover over time.

The main features of the seasonal reanalysis process

The aim of seasonal adjustment is to remove systematic calendar-related variation from the original series. For the total Australian retail turnover series, the systematic calendar-related variation in the original series is the combination of two elements, namely seasonal variation and trading day variation.

Seasonal variation is the variation in typical levels of retail activity for each month of the year, and reflects the fluctuations in the level of consumer spending for different months. Months which typically have a lower than average level of retail activity are described as seasonally low months, and those months which have a greater than average level of retail activity are called seasonally high months.

The day composition of each calendar month is the number of Mondays, Tuesdays, Wednesdays, etc. which occurs in that month. Monthly trading day variation arises from the variation in typical levels of retail activity for each day of the week, coupled with the day composition of the month.

Estimates of the seasonal variation present in time series published by the ABS are revised at least annually (usually in June) to take account of the additional twelve months' worth of data which have become available since the previous analysis. The seasonal reanalysis process usually results in some slight degree of revision to the estimates of the monthly levels of retail activity for recent years. All seasonally adjusted estimates of retail turnover in Retail Trade, Australia from the July 1995 issue onwards are based on the most recent seasonal reanalysis.

The main findings from the latest seasonal reanalysis:

The most recent estimates of *monthly* levels of total Australian retail turnover show that:

- November, and to a much greater extent December, are seasonally high months.
- January through October are seasonally low months (with March and August generally showing the lowest average level of activity).

However, in recent years there have been changes in the monthly pattern of activities, for example:

 The level of activity in December appears to be declining somewhat with a corresponding increase in January.

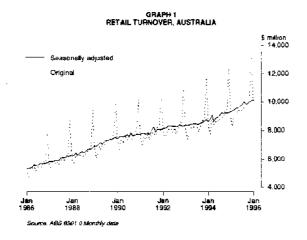

The most recent estimates of the daily levels of total Australian retail turnover for the last six years show that Wednesday is the busiest day in the week, followed in rank order by Thursday, Saturday, Friday, Monday, Tuesday and Sunday. However, changes in the trading day pattern, such as Sunday trading, have implied that retail activity is now spread more evenly across the days of the week.

The seasonal adjustment process and the results presented above are discussed in more detail below. It should be borne in mind that the results given in this article are for total Australian retail turnover, and the seasonal and trading day patterns exhibited by particular businesses or industries within retail or in particular States may differ markedly from those of the aggregate series.

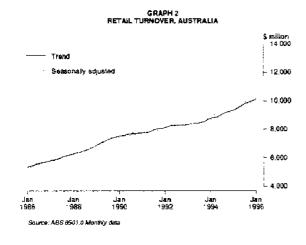

Why seasonally adjust?

Seasonal adjustment is intended to remove the systematic calendar-related variation from an original time series. Graph 1 shows total Australian retail turnover over the last ten years in its original and seasonally adjusted forms. The most obvious feature of the original series is the large upward movement for the months of November and especially December of each year, reflecting pre-Christmas shopping. The original series also appears to show that February is the quietest month for retail trade, but the dips that occur in that month are largely due to the fact that February is the shortest month of the year. The month-to-month movements in the original series are largely driven by systematic calendar-related influences, which contribute about 80% of the total variation, and the presence of such a large component swamps the other movements in the series. Often it is these other movements which may be of primary interest, and in that case the seasonally adjusted series provides a clearer picture.

The seasonally adjusted series shown in Graph 1 is considerably less variable than the original series, with an average absolute percentage change month-

to-month of 1.06% as compared to the original series which has a corresponding measure of 6.39%. It should be noted, however, that the seasonal adjustment process does not remove non-systematic irregular influences from the series, so seasonally adjusted series are usually not smooth. For many economic indicators, including retail turnover, the ABS also publishes trend series from which the irregular influences have been removed. Graph 2 shows total Australian retail turnover for the past ten years in its seasonally adjusted and trend forms.

There are instances where particular groups of users are interested in the seasonal and trading day patterns, even though for other purposes the seasonality present in the original series may be a hindrance to informed decision making. For example, businesses in the retail sector may be interested in gauging the timing and extent of seasonal variation in the level of sales activity to help them maintain appropriate stock levels or anticipate casual staff requirements. On the other hand, policy planners and macro-economic analysts generally wish to abstract from calendar-related influences, and are likely to find the seasonally adjusted and especially the trend series more suitable for their requirements.

The systematic calendar related effects present in total Australian retail turnover can be regarded as the combination of:

 the typical level of activity associated with each month of the year; and the typical level of activity associated with each day of the week.

Level of activity for each month of the year -Seasonal variation

The pattern of retail activity across the months of the year reflects several influences

One influence is the differing number of days in the twelve months of the year. If no other calendar related effects were present, then the amount of retail turnover recorded for the month of February (which has 28 days in a non-leap year and 29 in a leap year) would be less than for the other months. The amount of retail turnover recorded for April, June, September and November (which have 30 days) would in turn be less than for the remaining months (which have 31 days).

It is straightforward to remove the effect of the differing number of days in the various months from the data. Since normal years are 365 days in length and leap years 366 days long, an 'average' month is 365.25/12 = 30.4375 days in length. By comparing the actual number of days in a given month to the average number of days per month, an adjustment factor can be readily calculated. In practice, it is convenient during the X11 computations to include this length-of-month adjustment with the trading day adjustment discussed below.

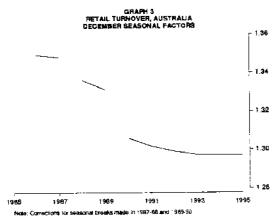

A second influence on the pattern of retail activity across the months is the occurrence of Christmas, other special days (such as Valentine's Day, Mother's Day and Father's Day), public holidays (such as Australia Day and Easter), and mark-down sales (such as post-Christmas, stocktake and end-of-financial-year sales). The issue about Mother's and Father's Days is that they fall on the first Sunday of the month. If the first Sunday happens to fall on the first few days of the month, it is likely that some, if not most, of the gift purchases would have spilled over to the previous month. Similarly, with the shifting of Easter, pre-Easter purchases are likely to fall in March if Easter is in early April.

A third influence is the run of seasons which affects spending on such things as winter and summer clothing, heating and cooling appliances and seasonal recreational equipment.

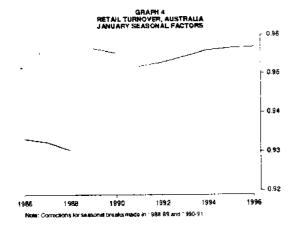

To estimate the seasonal variation in retail activity, X11 calculates a series which contains seasonal and residual/irregular variation, but which has had preliminary estimates of other influences such as trend removed. The seasonal-irregular values are grouped by month so that all the January observations are arranged in a yearly sequence, all the February observations are arranged in a second sequence, and so on for the other months. Each sequence is then smoothed (using a `seasonal moving average') to obtain an estimate of the typical level of retail activity for that month over time. This is a simplified description of the actual process involved; a more rigorous treatment is given in the *United States Bureau of the Census Technical Paper 15*.

An important feature of the X11 procedure is that it allows the seasonal pattern to be estimated even though that pattern is usually not fixed but is evolving year by year. For example, it appears that consumers have modified their behaviour by postponing some of their pre-Christmas spending (to take advantage perhaps of the January mark-down sales),

and as a result there has been a decrease in the level of activity for December and an increase in the level of activity for January over the past few years (see Graphs 3 and 4). Provided that the seasonal pattern evolves in a slow and continuous fashion, the seasonal moving averages generally work well in reflecting the changing seasonality. Occasionally the seasonality may change in a rapid or abrupt manner, and the estimates produced by the seasonal moving averages may fail to capture adequately the changing seasonal pattern. If necessary, ABS time series analysts apply an adjustment (called a 'seasonal break correction factor') to ensure that the estimates of seasonal variation properly capture the series behaviour. At each seasonal reanalysis the performance of the X11 procedure is carefully monitored and assessed to ensure that the estimates of seasonal variation used in producing seasonally adjusted series are appropriate.

The most recent estimates of monthly levels of total Australian retail turnover show that November, and to a much greater extent December, are seasonally high months. However, as mentioned above, the activity level in December appears to be declining somewhat over more recent years, with a corre-

sponding increase in January. January through October are generally seasonally low months but the level of activity varies from month to month:

March and August display the lowest level of activity. The level of activity in August has also fallen in recent years.

- The level of activity in April, May and June are higher than that of the preceding three months.
 The level of activity in April has increased in recent years.
- The level of activity in July is lower than in June but higher than in August.
- September and October are only a little below seasonally neutral (the average level of activity), although the level of activity in October has steadily increased over time.

Level of activity for each day of the week - Trading day variation

Monthly trading day variation refers to the variation in the level of activity which is related to the number of times each of the days of the week occurs in the calendar month. Some days of the week are busier for retail turnover than others. One of the reasons for this may be the pattern of pay days, Social Security payments etc. The composition of any particular month (in terms of the number of Mondays, Tuesdays, etc.) will affect the amount of retail turnover recorded for that month. The day composition of each calendar month varies from one year to the next. There are 22 different types of months:

- There are seven types of 31-day months. 31-day months beginning on Monday contain five Mondays, Tuesdays and Wednesdays and four of the other days of the week. 31-day months beginning on Tuesday contain five Tuesdays, Wednesdays and Thursdays and four of the other days of the week; and so on for months beginning on the other days.
- There are seven types of 30-day months. 30-day months beginning on Monday contain five Mondays and Tuesdays and four of the other days of the week; and so on for months beginning on other days.
- There are eight types of Februarys. There is one type of non-leap-year February, containing exactly four weeks and hence four occurrences of each day of the week. There are seven types of leap-year Februarys: one beginning on Monday; one beginning on Tuesday; and so on.

The day composition of any particular month can be ascertained by referring to a calendar, but the level of activity occurring on each day of the week is usually unknown, and must be estimated in order to apply a trading day adjustment. Unfortunately, estimating trading day variation is more problematic than estimating the trend or seasonal variation of a time series. The required information could in theory be obtained by asking respondents to provide figures on their daily turnover, but this would entail a massive increase in respondent load and would be tantamount to conducting a daily, rather than a monthly, survey. Many survey respondents could, if asked, provide anecdotal evidence about which days of the week are busy and which are quiet for their particular businesses, but qualitative descriptions such as `Saturdays are our busiest days but Wednesdays are slow' are not very useful, since what are required are numerical measures. Even when available, anecdotal evidence may not be in agreement with the actual pattern observed in the data, which may be influenced by bookkeeping, reporting or data processing practices. Due to the cost and difficulty involved, the activity levels occurring on the different days of the week are not obtained from external evidence but instead are estimated from the monthly time series itself. The resulting measures of activity level for each of the days of the week are known as the 'daily weights'.

Estimating daily weights

In contrast to the task of estimating the annual pattern of level of activity associated with each month of the year (where a yearly pattern is being extracted from monthly data), estimating the daily weights requires a weekly pattern to be extracted from monthly data. In the first instance, a lower frequency pattern is being estimated from higher frequency data, and moving averages can be used. In the second instance, however, a higher frequency pattern is being estimated from lower frequency data and some model must be imposed on the relationship between pattern and data. The X11 procedure uses a multiple regression model to estimate daily weights; this imposes a couple of constraints on the time series analyst, which in turn have consequences for users of the retail statistics:

- First, fitting a regression model demands a reasonable amount of data if the results are to be accurate enough to be useful for adjusting series. X11 needs at least five years of data (60 monthly observations) for its trading day algorithm to become operative.
- Second, the daily weight estimates given by the regression model are fixed numerical values. The standard procedure is to apply the regression model to the whole span of the time series, so the daily weights are assumed not to change from year to year.

This second constraint is unrealistic for a series such as total Australian retail turnover, as there is a good deal of evidence that there have been substantial changes in the proportions of activity occurring on particular days of the week during the past three decades. Series for which the proportion of total activity occurring on particular days of the week changes through time are said to exhibit a `moving trading day' effect.

Causes of moving trading day effect

Retail trade estimates published in Retail Trade, Australia are given for the eight States and Territories and by seven industry groups, each of which contains several subgroups as set out in the explanatory notes of that publication. Estimates of retail turnover at the total Australia level have been published since 1965, while retail industry estimates at the State and Australian levels have been included in the survey starting in 1982. The Northern Territory (by broad industry) was added in 1988. The total Australia series is seasonally adjusted separately from the State and industry series as data are available over a much longer time span. Conceptually, however, the total Australia retail turnover series can be regarded as the sum of a large number of component series, each of which has its own trading day pattern. The moving trading day effect present in total Australian retail turnover arises from changes in the trading day patterns of component series and also from changes in the relative contribution of those components to the total. Some changes in the trading day patterns of component series are sudden, while others are relatively gradual.

Changes in the trading day patterns for component series

Among the rapid changes that have affected the turnover series for some States are amendments to legislation about trading hours; in particular, the restrictions on Sunday trading have been relaxed and the level of retail activity on Sunday has increased. Changes of a more gradual nature include the tendency in more recent years of some retailers (such as major supermarket chains) to keep their stores open for extended hours or around the clock. Customers have altered their shopping habits in response.

Changes in the contributions by component series.

Examples of businesses that have made an increasing contribution to retail turnover over more recent years (and whose particular trading day patterns have a greater impact on the total Australia series than previously) are supermarket and grocery stores and cases and restaurants. Clothing retailers and hotels and licensed clubs are among the businesses whose relative contribution has decreased.

Tuning the trading day adjustments

In applying the X11 seasonal adjustment procedure (in particular, when using a multiple regression model to estimate daily weights), the ABS has sought to strike a compromise between two conflicting aims of trading day estimation:

- The first aim is to make the adjustment as relevant as possible to the pattern in a given period, especially at the current end of the series which is of greatest interest to users. When the trading day influences are evolving, this suggests using as short a span of data as possible to estimate the daily weights.
- The second aim is to make the estimates of daily weights (and hence of the trading day adjustment) as statistically accurate as possible. This suggests using as long a span of data as possible when estimating the daily weights.

To make allowance for the moving trading day effect evident in total Australian retail turnover while still providing enough data to the regression model, the series is broken up into a number of contiguous segments or sub-spans, each of which has its trading day pattern estimated separately. Bearing in mind that at least five years' worth of data must be included in each sub-span, it is not possible to fit a large number of very short sub-spans. Fairly long sub-spans are used to ensure that the daily weights obtained are of acceptable accuracy, while the fact that the weights for each day are free to change between sub-spans allows the daily weights to adapt to changes in the trading day pattern over time.

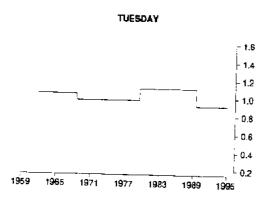

While the use of data sub-spans for trading day estimation undoubtedly represents an advance on estimating a fixed set of daily weights over the entire series, a sudden change in the trading day pattern cannot be successfully estimated until sufficient data containing the new pattern become available. If such a change starts to develop it is usually necessary to wait for at least two to three years of data with the new pattern to be collected and tabulated, and even then the daily weights estimated from the last subspan may not be an especially good fit to either old or new pattern but rather a compromise between the two. In this situation the cut-off date between

the last two sub-spans, and the daily weights for each sub-span, may need to be periodically revised as more data become available for analysis. This can lead to revisions in the last several years of seasonally adjusted estimates. The impact on trend estimates of revisions to the daily weights is usually minor.

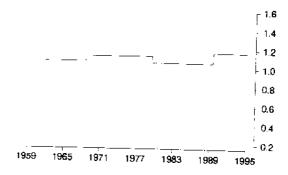

At the present time the sub-spans used for trading day estimation of total Australia retail turnover cover the periods April 1962 to December 1968, January 1969 to December 1979, January 1980 to December 1989, and January 1990 to the end of the series. The daily weights are constructed so that they must sum to seven, which implies that the average level of activity must equal one. A low (high) activity day is one which has trading day weights below (above) 1. An examination of the daily weight changes between the four sub-spans reveals that Monday is a consistently low activity day over the whole series, while Tuesday is more variable, being sometimes above average and sometimes below. Wednesday and Thursday are consistently high activity days while Friday is also a high activity day but has become considerably less so over the most recent time period. The level of activity for Saturday is about average and Sunday is a low activity day but showing a noticeably increased level of activity for the latest period. (See Graph 5 below)

FRIDAY

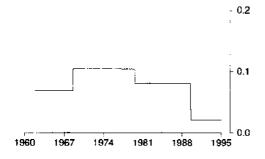

SATURDAY

However, changes in the trading day pattern, such as Sunday trading, have implied that retail activity is now spread more evenly across the days of the week. The average deviation of each day's level of activity from the neutral or average level has lessened (see Graph 6). This implies that the influence that the trading day pattern has on retail turnover estimates has lessened in recent years.

As the patterns of trading day activity present in total Australian retail turnover evolve, the ABS will continue to monitor the daily weight estimation process in the light of new data as it becomes available and will make changes as required.

The ABS is conducting an ongoing program of research with the aim of developing improved

procedures for estimating trading day variation when moving trading day effect is present. One technique which is currently being investigated uses a 'sliding' sub-span or moving data window to estimate daily weights which are able to vary over the length of the series, rather than being fixed within sub-spans. The raw regression estimates obtained in this way are unacceptably volatile and are smoothed using moving averages to give better results. For most of the length of the series a sliding sub-span centred on the point of time at which the daily weights are being estimated is used, but at the ends of the series a centred sub-span cannot be used as there is insufficient data and the method must be modified. The technique is still experimental, and is used by ABS time series analysts mainly as an investigatory tool and to corroborate the fixed sub-span estimates. After further refinement and development, the sliding-span procedure may prove to be a viable alternative to the fixed sub-span method of producing trading day adjustments for officially released statistics.

Conclusion

The seasonal adjustment of total Australian retail turnover involves the decomposition of the original series into a trend series, systematic calendar related effects, and residual/irregular variation. The second of these represents the combined effect of the level of activity for each month of the year, and trading day variation resulting from the different amount of retail turnover associated with each day of the week. Estimates of the seasonal variation present in time series published by the ABS are revised annually, and in the light of evidence suggesting possible changes in retail trading patterns, including increased retail activity on weekends, the adjustment for trading day influences was substantially revised at the last seasonal reanalysis.

ABS PUBLICATIONS AND PRODUCTS

Statistics collected by the ABS are generally made available in published form. Some including those not published, are available in one or more of the following forms: microfiche, magnetic tape, computer printout, CD, floppy disk, photocopy and clerically extracted tabulation.

Current publications produced by the ABS are listed in the Catalogue of Publications and Products, Australia (1101.0). The ABS also issues on Tuesdays and Fridays a Release Advice (1105.0) which lists publications to be released within the next few days. The Catalogue and Release Advice are available from any ABS Office.

To receive ABS publications on a regular basis contact the ABS *Publication Mailing Service* on 1800 02 0608.

A large range of data is available via on-line services, diskette, magnetic tape, tape cartridge and CD ROM. For more details about our electronic data services, contact any ABS Office.

The ABS Information Consultancy Service has specialist staff to assist and advise clients

with their statistical inquiries. For more detailed information about these services call at the ABS, 55 Currie Street, Adelaide, telephone the Information Officer on (08) 8237 7100, or write to Information Service, ABS, GPO Box 2272, Adelaide SA 5001.

The ABS also provides a *Statistical Consultancy Service*, for expert assistance in survey, sample and questionnaire design, data collection, processing and analysis, and statistical modelling. For more information contact Gary Niedorfer, telephone (08) 8237 7379.
