SUMMARY OF FINDINGS

LEADING CAUSES OF DEATH

There were 125,124 deaths registered in Australia in 1995. This is a decrease of 1.2% from 1994. There were 66,246 male deaths and 58,878 female deaths in 1995 representing decreases of 1.8% and 0.6% respectively from 1994.

Cancer and ischaemic heart disease continue to be the two leading causes of death, accounting for about 51% of all deaths. The rankings of the other major causes of death are also unchanged from 1994. The standardised death rate for most leading causes of death declined between 1994 and 1995.

While there have been fluctuations in the recent period, the standardised death rate from all causes combined declined by 15% between 1984 and 1994. The standardised death rate for 1995 of 646 deaths per 100,000 population, was a decline of 4% on 1994.

The male standardised death rate is higher than that for females for most causes of death. Senile dementia is the only leading cause for which the male and female rates are equal. For some leading causes, the number of female deaths exceeds the number of male deaths. These are cerebrovascular disease, senile dementia, and hereditary and degenerative diseases of the central nervous system, all usually associated with older age groups in which females predominate. Diabetes also caused slightly more female than male deaths in 1995.

LEADING CAUSES OF DEATH: NUMBER, RATE AND PER CENT, 1995

¹ Standardised death rate per 100,000 of the mid-year 1991 population. See Glossary for further explanation.

CAUSES OF DEATH BY STATE/TERRITORY OF USUAL RESIDENCE

The decrease in the overall standardised death rate between 1994 and 1995 is evident in all States and Territories, with the Australian Capital Territory recording the highest percentage decline (13%), and Victoria the lowest (2%).

LEADING CAUSES OF DEATH: RATE¹ BY STATES AND TERRITORIES OF USUAL RESIDENCE, 1995

¹ Standardised death rate per 100,000 of the mid-year 1991 population. See Glossary for further explanation.

The death rate for ischaemic heart disease declined by 28% in the Northern Territory and 19% in the Australian Capital Territory, while the declines in cerebrovascular disease for the two Territories were 15% and 23% respectively.

The standardised death rate for accidents increased by 10% in Victoria between 1994 and 1995 while all other States and Territories recorded a decrease. The Australian Capital Territory (15%) and Tasmania (13%) experienced the largest declines.

At a national level, suicide rates have been relatively stable at around 13 deaths per 100,000 population since the late 1980s. The State and Territory rates have shown greater fluctuations over the same period. In 1995 there was a 27% increase in the standardised death rate for suicides in South Australia. Victoria and the Australian Capital Territory each recorded an increase of 9%, while the Queensland rate increased by 7%.

Of the total 813 deaths reported in the Northern Territory, 48% (387 deaths) occurred among the Indigenous population who make up 27% of the Territory's total population. Thus the death rates observed in the Northern Territory are substantially affected by the mortality experience of the Indigenous population.

**CAUSES OF DEATH
BY AGE**

The relative importance of different causes of death varies with age. For those aged from 1–44 years accidents are the leading cause. Malignant neoplasms are the second leading cause in these younger age groups, except for those aged 15–24, where it is suicide. For those aged 45 years and over, neoplasms and ischaemic heart disease are the leading causes, with the latter more significant than neoplasms in those aged 75 and over. Cerebrovascular disease also becomes more prominent as a cause of death in the elderly.

LEADING CAUSES OF DEATH: PROPORTION OF DEATHS IN ALL AGE GROUPS, 1995

Cause of death and ICD code	Age group (years)

**MALIGNANT NEOPLASMS
(CANCERS)**

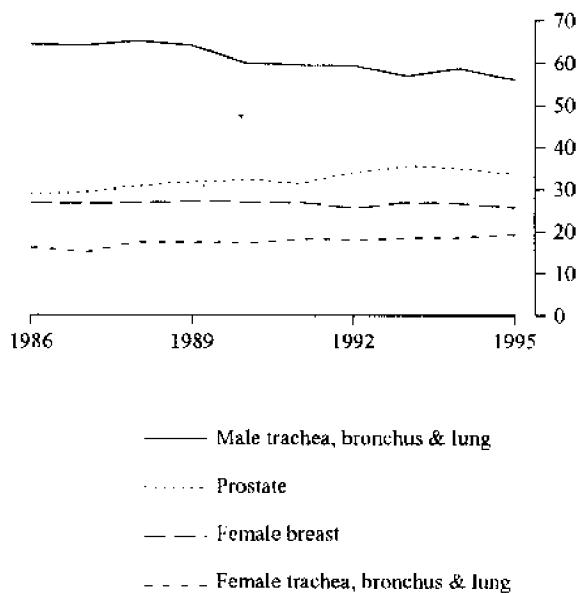

For the last three decades the male standardised death rate has fluctuated around 230 deaths per 100,000 population, except in 1994 where it increased to 239. However in 1995 it returned to its previous level, at 232 deaths per 100,000. The female death rate remained unchanged from 1994 at 139 deaths per 100,000 population.

In 1995, cancer of the trachea, bronchus and lung accounted for 25% of all male cancer deaths followed by prostate cancer (14%) and colon cancer (9%). The standardised death rate from cancer of the trachea, bronchus and lung declined by 5% for males from 59 deaths per 100,000 population in 1994 to 56 in 1995. In 1995, the females standardised death rate from cancer of the trachea, bronchus and lung remained virtually unchanged at the 1994 level of 19 deaths per 100,000.

The standardised death rate for prostate cancer was 33 deaths per 100,000 in 1995. This rate increased slowly from 29 deaths per 100,000 in 1986 to 35 in 1993, but has declined over the past two years.

Among females, breast cancer accounted for 18% of all cancer deaths, followed by cancers of the trachea, bronchus and lung (14%) and of the colon (11%). The standardised death rate for female breast cancer has remained stable at around 27 deaths per 100,000 population over the last 10 years.

DEATHS DUE TO CANCER, STANDARDISED RATES BY SITE, 1986–95

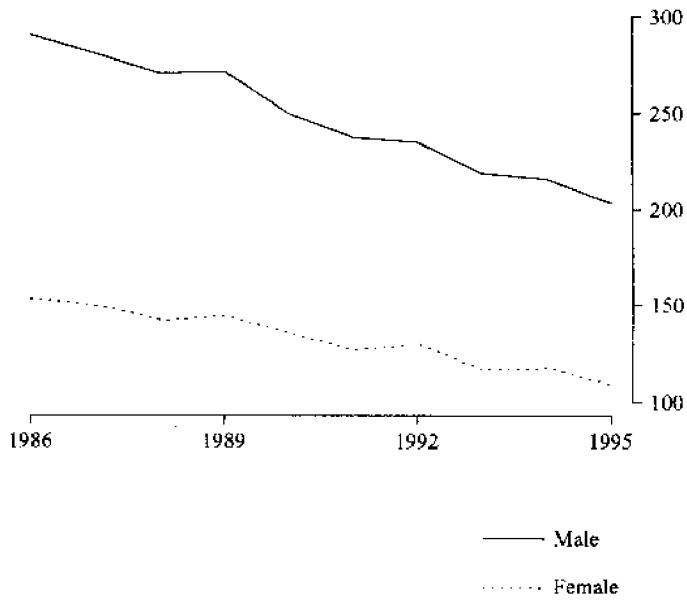

ISCHAEMIC HEART DISEASE

In 1995, ischaemic heart disease accounted for about 55% of all deaths (53,402) ascribed to circulatory diseases. About 61% of deaths from ischaemic heart disease were due to heart attacks (myocardial infarctions).

The standardised death rate from ischaemic heart disease for males is almost double the respective rate for females. Between 1994 and 1995, the standardised death rate from ischaemic heart diseases declined for males by 6% and by 8% for females. Between 1986 and 1995 the standardised death rate declined by almost 30% for both males and females, the downward trend being greater among males than females.

DEATHS DUE TO ISCHAEMIC HEART DISEASE, STANDARDISED RATES, BY SEX, 1986–95

EXTERNAL CAUSES (ACCIDENTS, POISONINGS AND VIOLENCE)

External causes accounted for 6% of all deaths in 1995, with the standardised rate unchanged from the 1994 rate of 40 deaths per 100,000. The great majority of deaths from external causes (94%) were accidents or

suicide. Accidents ranked as the fifth and suicides as the eighth leading causes of death in Australia in 1995, but they ranked second and fourth respectively as causes of premature death (see Technical Note — Years of Potential Life Lost).

The standardised death rate for external causes for females increased marginally in 1995 from 21 to 23 deaths per 100,000 population, while the death rate for males remained unchanged at 59. There were increases in the female age-specific death rate in the younger and middle aged groups — the age-specific death rate increased by 14% in the 1–14 age group, 21% in the 15–24 age group, 6% in the 25–44 age group and 16% in the 45–54 age group. An increase in female deaths due to motor vehicle traffic accidents was responsible for most of this rise. Motor vehicle traffic accidents made up 44% of all accidents.

The standardised death rate from suicide for males in 1995 remained unchanged at the 1994 level of 20.9 deaths per 100,000 population but the female death rate rose slightly from 4.7 to 5.2. The male standardised death rate from suicide was four times higher than that for females. The highest age-specific death rate from suicide was for males aged 85 years and over, with 41 deaths per 100,000 population.

ACQUIRED IMMUNE DEFICIENCY SYNDROME (AIDS)

For the first time since the ABS began collecting AIDS mortality data in 1986 the total number of AIDS-related deaths decreased by 13% over the previous year. The decrease was mainly due to a reduction in the number of deaths where AIDS was mentioned on the death certificate rather than where AIDS was the underlying cause of death. Department of Health and Family Services AIDS Surveillance data shows a similar decrease.

AIDS-RELATED DEATHS, BY SEX, 1991–95

	Sex	1991	1992	1993	1994	1995
Directly attributed to AIDS	Male	380	450	451	481	467
	Female	15	14	18	26	27
	Person	395	464	459	507	494
Condition mentioned on medical certificate	Male	178	171	238	240	162
	Female	9	8	11	17	10
	Person	187	179	249	257	172
Total	Male	558	621	689	721	629
	Female	24	22	29	43	37
	Person	582	643	718	764	666

Although the age-specific death rate from AIDS-related deaths decreased by 17% in the 35–44 years age group and 13% in the 45–54 years age group these two groups accounted for 60% of all AIDS-related deaths.

Of the total AIDS-related deaths reported in 1995, the majority (74%) were directly attributed to AIDS. Other conditions frequently associated with AIDS-related deaths included infectious and parasitic diseases (8%) and neoplasms (10%).

INFANT DEATHS

In 1995, there were 1,449 deaths (807 males and 642 females) of children before their first birthday, 4% fewer than in 1994. The infant death rate was 5.7 deaths per 1,000 live births compared to 5.9 in 1994, continuing the downward trend in recent years.

Most infant deaths were due to conditions present since birth and 63% of infant deaths occurred within 28 days of birth. Most infant deaths were again ascribed to conditions originating in the perinatal period (46%). Of these

conditions slow fetal growth, fetal malnutrition and immaturity caused 16% of infant deaths and hypoxia, birth asphyxia and other respiratory conditions 13%. Other leading causes apart from perinatal conditions were congenital anomalies (27%) and signs, symptoms and ill-defined conditions (14%), of which sudden death, cause unknown (SIDS) is the major component. SIDS continued to be the leading cause of post-neonatal infant deaths (deaths after the first 28 days of life).

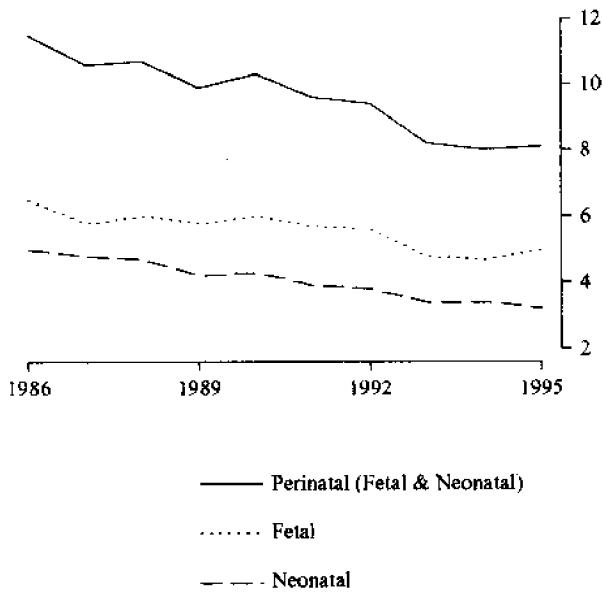

PERINATAL DEATHS

Perinatal deaths comprise stillbirths (fetal deaths) and deaths of infants within the first 28 days of life (neonatal deaths). There were 2,094 perinatal deaths in 1995, a slight increase on the 2,075 deaths in 1994. The perinatal death rate also showed little change, increasing by 1% from 8.0 to 8.1 deaths per 1,000 births. Of the perinatal deaths, 61% were fetal deaths and 39% were neonatal deaths.

Fetal deaths The 1,283 fetal deaths in 1995 is an increase of 6% over the 1,207 deaths in 1994. The fetal death rate also rose by 6%, from 4.7 to 5.0 deaths per 1,000 births, mainly due to an increase in the female rate, which rose from 4.1 deaths per 1,000 births to 4.8, whereas the male rate remained at 5.2 deaths.

Neonatal deaths The 811 neonatal deaths represented a decrease of 6% from the 868 deaths in 1994. As a consequence, the neonatal death rate fell from 3.4 deaths per 1,000 live births to 3.2. The neonatal death rate for males fell from 3.9 to 3.6 deaths per 1,000 live births while the rate for females showed no change at 2.8 deaths.

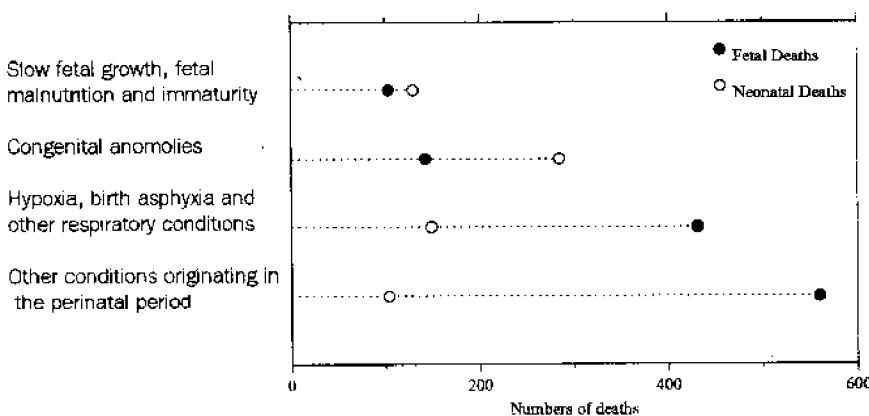

PERINATAL, FETAL AND NEONATAL DEATH RATES, 1986-95

Causes of death

Congenital anomalies were responsible for 20% of perinatal deaths while 65% were due to conditions originating in the perinatal period. Of these conditions, hypoxia, birth asphyxia and other respiratory conditions caused 28% of perinatal deaths, and slow fetal growth, fetal malnutrition and immaturity 11%. In many cases a specific perinatal condition could not be assigned (23% of all perinatal deaths).

PERINATAL DEATHS: MAIN CAUSES OR CONDITIONS IN FETUS/INFANT, 1995

The medical certificate of perinatal death allows for causes or conditions in the mother to be noted as well as those in the fetus or infant. For 61% of perinatal deaths, a maternal condition was noted on the certificate. The most common maternal condition was complications of the placenta, cord and membranes, which was noted for 30% of deaths. Maternal complications of pregnancy was noted for 17% of perinatal deaths.

Age of mother Children born to mothers aged less than 20 years had the highest perinatal death rate, of 14.1 deaths per 1,000 births, with those born to mothers over 40 having the second highest with 12.0 deaths per 1,000 births. Children of mothers aged 25–34 had the lowest perinatal death rates, of around 6.8 deaths per 1,000 births.

State and Territory mortality The Northern Territory had a perinatal death rate of 14.0 deaths per 1,000 births, the highest of any State or Territory. This is largely due to a high perinatal mortality rate for Indigenous children (22.6 deaths per 1,000 births) whereas the rate for non-Indigenous children was 9.1. Rates for the other States and the Australian Capital Territory ranged from 7.7 deaths per 1,000 births in Victoria to 8.9 deaths per 1,000 births in Queensland.

FEATURE ARTICLE — DEMENTIA DEATHS AMONG THE ELDERLY, 1981–95

GENERAL

Dementia is caused by a variety of chronic brain disorders. It is characterised by deterioration or loss of memory and intellectual faculties, reasoning power, memory and will. Although dementia can affect young adults, it is much more common among elderly people. Dementia deaths covered in this analysis are those where the underlying cause has been categorised to one of the following specific conditions in the International Classification of Diseases (version 9) (ICD-9):

- Senile and presenile organic psychotic conditions (290); which comprises:
 - Senile dementia simple type (290.0);
 - Presenile dementia (290.1);
 - Senile dementia depressed or paranoid type (290.3);
 - Arteriosclerotic dementia (290.4);
- Dementia in conditions defined elsewhere (294.1) and
- Alzheimer's disease (331.0).

Dementia is estimated to affect about 2% of the population aged between 65 and 70 years and about 20% of the population above 80 years.¹ Deaths from dementia account for about 3% of all deaths among the population aged 65 years and over, but ranks as the fourth leading cause of death in this age group, after malignant neoplasms (27%), ischaemic heart disease (24%) and cerebrovascular disease (10%). Although dementia has been recognised as a significant health problem affecting the elderly in Australia, there are no reliable national data to monitor the prevalence or incidence. The only information on dementia nationally available comes from death registration statistics. These statistics reveal only part of the dementia problem in that they only provide the frequency of fatal outcome of dementia.

OVERALL LEVELS AND TRENDS

Dementia deaths among persons 65 years of age and over increased from 582 in 1981 to 3,313 in 1995. During this period the elderly population increased by 48%. The incidence of and the number of deaths from dementia are expected to increase as the population continues to age. However, the main contributing factor to the rapid rise in dementia deaths in Australia, particularly in the 1980s, is the increasing tendency for dementia to be diagnosed as an underlying cause of death among elderly people.^{1,2}

² Jorm, A.F., Henderson, A.S and Jacomb, P.A (1989) 'Regional differences in mortality from dementia in Australia: an analysis of death certificate data' *Acta Psychiatr Scand* Vol 79:179–85.

² Department of Health, Housing and Community Services (1992) *Putting the pieces together: A national action plan for dementia care*. AGPS, Canberra.

Of the various dementia disease conditions, the death rate from Alzheimer's disease increased much faster than that of the other dementias. Between 1981 and 1983, Alzheimer's disease accounted for 11% of the total deaths classified to dementia but by 1993-95 this proportion had increased to 33%.

¹ Standardised per 100,000 of the mid-year 1991 population. See Glossary for further explanation.

² Includes senile and presenile organic psychotic conditions (ICD-9 code 290) and dementia in conditions classified elsewhere (ICD code 294.1).

AGE DISTRIBUTION

Dementia deaths increase rapidly with ageing. The empirical evidence³ available suggests that dementia prevalence rises exponentially over age and is expected to double for every 5.1 years of age. It should be noted, however, that dementia, mainly Alzheimer's disease, has a substantial time lag between the onset and diagnosis of symptoms, and the likelihood of diagnosing dementia as the underlying cause of death is, therefore, greater for older populations.

The rapid rise in age-specific death rates over time suggests that the changes in diagnostic practices, may account for part of the increase.

³ Jorm, A.F. and Henderson, A.S. (1993) *The problem of dementia in Australia*, Aged and Community Care Division, Department of Health, Housing and Community Services, AGPS, Canberra.

AGE DISTRIBUTION OF DEMENTIA DEATHS: AVERAGE AGE-SPECIFIC DEATH RATES, 5-YEAR PERIODS, AND SEX, 1981-95

Age group	<i>Five year periods</i>		
	1981-85	1986-90	1991-95
MALES			
65-69	9.5	11.0	11.9
70-74	24.0	31.4	34.2
75-79	65.8	100.8	101.2
80-84	142.8	246.0	281.9
85-89	269.9	501.0	623.4
90-94	473.9	836.4	1031.1
95 and over	576.9	998.9	1669.8
65 years and over	50.5	55.5	104.7
Standardised death rate ¹	66.0	109.2	128.3
FEMALES			
65-69	5.9	11.0	9.8

95 and over	682.2	1390.4	2121.5
65 years and over	57.6	112.6	155.5
Standardised death rate ¹	53.4	98.7	127.0

¹ Standardised per 100,000 of the mid-year 1991 population. See Glossary for further explanation.

SEX DISTRIBUTION

Generally, the overall age-standardised male dementia death rate has been higher than the female rate. However, whereas age-specific death rates are higher for males in the earlier age groups, they are higher for females in the upper age groups. The higher dementia mortality among females in the upper age groups could reflect the later onset (or slower progression) of dementia conditions in females.

FUTURE PROSPECTS

The ageing of the Australian population will continue with the survivors of the post-war baby boom reaching age 65 sometime after the year 2011. The total number of persons aged 65 years or more, is expected to rise from about 2.9 million in 2011 to about 4.9 million by the year 2031. With a progressively increasing elderly population, more persons will survive to older ages where dementia mortality is highest.

If the age-specific death rates remain constant at 1995 levels, the rapid growth of the elderly population will increase the number of dementia deaths. The increase in deaths will be particularly high as the number of persons aged 85 years or more, are expected to rise much faster than other elderly groups. The projected increase in the elderly population is 58% between 1989 and 2011 and 173% between 1989 and 2031. However the prevalence of dementia among persons aged 65 years or more is estimated to rise by 93% between 1989 and 2011, and by 234% between 1989 and 2031¹.

(a) Applicable to neonatal deaths only.

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains summary statistics on causes of death for the general population, together with selected statistics on perinatal deaths. These statistics have been compiled from data made available by the Registrar of Births, Deaths and Marriages in each State and Territory. Statistics of perinatal deaths for years prior to 1994 were published separately in *Perinatal Deaths, Australia* (3304.0), which has been discontinued. Perinatal deaths comprise fetal deaths (stillbirths) and neonatal deaths (deaths within 28 days of birth).

SCOPE AND COVERAGE

2 The statistics relate to the number of deaths registered, not those which actually occurred, in the years shown. Normally about 5% to 6% of deaths occurring in one year are not registered until the following year or later.

3 In 1988 revisions were made to the Northern Territory legislation to enable the registration of a death prior to the certification of cause. As a result, deaths registered in the Northern Territory in 1988 included a number of deaths which would not necessarily have been registered in 1988 under the former legislation. This should be borne in mind when comparing statistics for 1988 and later years with statistics for earlier years.

Perinatal death statistics

4 The perinatal death statistics contained in this publication include all fetuses and infants (who died within 28 days of birth) weighing at least 500 grams or (when birthweight is unavailable) having the corresponding gestational age (22 weeks) or body length (25cm crown-heel). This definition of perinatal deaths has been in use since 1979, in accordance with recommendations of the World Health Organisation (WHO) for compiling national perinatal statistics.

5 Perinatal death statistics compiled using other birthweight criteria are available (see paragraph 27).

6 The birth statistics used to calculate the perinatal and neonatal death rates in this publication, are shown in Appendix — Populations For Use in Calculating Perinatal Death Rates. In line with WHO recommendations, the registered live birth statistics and stillbirth statistics have been adjusted to exclude infants who are known to have weighed under 500 grams. Such births are identified from the medical certificate of perinatal death, which records birthweight. In 1995 there were 229 fetal deaths and 97 neonatal deaths where birthweight was known to be under 500 grams. However, infants who survived 28 days or more but weighed less than 500 grams at birth have not been excluded since figures for weight at birth are not available for these infants. The adjusted live birth statistics shown in the Appendix (and rates based on them), therefore, must be considered approximate.

7 The adjusted live birth statistics therefore differ from the live birth statistics used to derive the infant death rates in this publication. The statistics used to calculate infant death rates include all registered live births regardless of birthweight. These statistics are shown in tables A1 and A2 of Appendix — Populations For Use in Calculating Death Rates (Excluding Perinatal Death Rates).

8 The adjusted birth statistics also differ from the statistics published in *Births, Australia*, which are unadjusted for birthweight and which also, for years prior to 1993, include births which occurred in Other Territories.

STATISTICS FOR STATES
AND TERRITORIES

9 Cause of death statistics for States and Territories in this publication have been compiled in respect of the State or Territory of usual residence of the deceased, regardless of where in Australia the death occurred and was registered. The State or Territory of usual residence of perinatal death is determined by the State or Territory of usual residence of the mother. Statistics compiled on a State or Territory of registration basis are available on request.

10 The Australian Standard Geographical Classification (ASGC) versions used since 1993 have a category Other Territories comprising Jervis Bay, Christmas Island and Cocos (Keeling) Islands. In the past, Jervis Bay was included with Australian Capital Territory and the two island Territories were included in Offshore and Migratory. Since 1993 statistics for Other Territories have been excluded from this publication.

CAUSE OF DEATH
CLASSIFICATION USED

11 The causes of death in this publication are classified according to the Ninth (1975) Revision of the World Health Organisation's International Classification of Diseases (ICD) which was adopted for world-wide use from 1979. Particulars relate to the underlying cause of death, which the WHO has defined as the disease or injury which initiated the train of morbid events leading directly to death. Accidental and violent deaths are classified according to the external cause, that is, to the circumstances of the accident or violence which produced the fatal injury rather than to the nature of the injury.

12 The extensive nature of the ICD enables classification of causes of death at various levels of detail. For the purpose of this publication, three summary classifications are used. They are:

- The ICD at the Class level (with further disaggregation for major causes of death);
- The ICD Mortality List of Fifty Causes (with certain sub-divisions); and
- Main Causes of Death for Age groups.

13 Table 1 utilises the Mortality List of Fifty Causes. Tables 2–4 present statistics at the ICD Class level. Background on both these summary classifications is given in Volume 1 of the ICD.

14 Tables 5–13 present time-series data for main causes of death for age groups. For each age group, a summary classification of the main causes of death relevant to the age group has been used. These consist of causes of death significant in that age group, at the class level, with further disaggregation below the class level where appropriate.

15 To enable the reader to see the relationship between the various summary classifications used in this publication, all tables show in brackets the ICD codes which constitute the causes of death described.

Perinatal statistics

16 For perinatal deaths, both the main condition in the fetus/infant, and the main condition in the mother are coded to the full four-digit level of the ICD. An abridged version of ICD was used in perinatal deaths publications prior to 1983. However, with the decline in perinatal mortality that has occurred, some categories of that classification are now responsible for few perinatal deaths. Causes selected for publication in this issue are those categories of this abridged classification which were responsible for a significant proportion of perinatal deaths.

AGE GROUPS

17 Prior to 1994 the oldest age group used in *Causes of Death, Australia*, was the 75 years and over age group. Since the 1994 publication this age group has been disaggregated to enable identification of the 75-84 years age group and the 85 and over age groups. This is the result of the increased populations in these age groups as a result of longer life expectancy. Data for earlier years are available on this basis.

DATA QUALITY

18 The registration of deaths is the responsibility of the individual State and Territory Registrars of Births, Deaths and Marriages. As part of the registration process, information as to the cause of death is supplied by the medical practitioner certifying the death or by a coroner. (Guidelines for the provision of cause of death information are made available to medical practitioners by the ABS.) Other information about the deceased is supplied by a relative or other person acquainted with the deceased, or by an official of the institution where the death occurred. This information is provided to the ABS by individual Registrars for compilation into aggregate statistics shown in this publication.

19 In compiling these statistics, the ABS employs a variety of quality control measures to ensure that the statistics are as reliable as possible. These measures include: seeking further information where necessary to enable accurate classification of the underlying cause of death; check-coding of cause of death; detailed computer editing of data; and checks on the statistical output, at the individual record and aggregate levels.

20 Since 1993 all processing of cause of death information for Australia has been carried out in the Queensland office of the ABS. Centralised processing is considered to lead to more consistency in coding and improved data quality.

Indigenous deaths

21 There is a variation in the quality of death registration data for Indigenous persons. In these statistics, an Indigenous death is the death of a person who has been identified on the death certificate or death information form as being of Aboriginal or Torres Strait Islander origin. The ABS estimates that there is under identification of Indigenous status on the death certificates or forms of death. Only South Australia, Western Australia, the Northern Territory and the Australian Capital Territory have Indigenous death registration data considered to be of publishable standard. It is estimated that more than 90% of Indigenous deaths in those States and Territories are identified. In New South Wales, Victoria and Tasmania Indigenous deaths are significantly under identified. Queensland has only recently begun to identify Indigenous deaths in its registration process. Because the data are on a State of usual residence basis, deaths of South Australian, Western Australian, Northern Territory and Australian Capital Territory residents which occur in other States may be identified less completely than if the deaths had been registered in South Australia, Western Australia, the Northern Territory or the Australian Capital Territory.

POPULATIONS

22 The crude and age-specific death rates and YPLL shown in this publication have been compiled using estimates of resident populations based on 1991 population census final data. The population estimates for the year 1994 have been revised also, using final 1991 census data. Rates shown in table 14 for the year 1994 have been compiled using these revised population estimates.

23 Appendix — Populations Used for Calculating Rates provides details of the number of live births registered and the estimated age and mean resident populations which have been used to calculate the rates shown in this publication. The appendix figures also enable further rates to be calculated.

RELATED PUBLICATIONS

24 Other ABS publications which may be of interest include:

Births, Australia (3301.0) — issued annually

Deaths, Australia (3302.0) — issued annually

Suicides, Australia 1982–1992 (3309.0) — issued irregularly

Trends in Mortality (3313.0) — issued irregularly

Social Indicators (4101.0) — issued irregularly

Australian Social Trends (4102.0) — issued annually

Women's Health (4365.0) — issued irregularly

UNPUBLISHED DATA

25 Tables containing more detailed cause of death information by sex and/or age group at death are available on hard copy and microfiche from any ABS office. These tables are available on a State or Territory of usual residence or State or Territory of registration basis.

26 In addition, information on other particulars of the deceased is available (see Unpublished statistics on causes of death, page 64). Users who are interested in obtaining tabulations of cause of death by any of these particulars can be provided with the information in one or more of the following forms: photocopy, magnetic tape and electronic media, computer printout and clerically-extracted tabulation. Generally, a charge is levied for providing unpublished information.

27 Perinatal tabulations for Australia based on the WHO international definition, i.e. all fetuses and infants (who die within seven days of birth) weighing at least 1,000 grams or (when birthweight is unavailable) having the corresponding gestational age (28 weeks) or body length (35 cm crown-heel) are available on request. Statistics can also be provided for all States and Territories for all fetuses weighing at least 400 grams or not less than 20 weeks gestational age and also for infants who die within 28 days of birth.

EFFECTS OF ROUNDING

28 Where figures have been rounded, discrepancies may occur between totals and sums of the component items.

APPENDIX — UNPUBLISHED STATISTICS ON CAUSES OF DEATH

GENERAL

Causes of death data are available from calendar year 1964, in a variety of forms through our special data service. Please note that for comparability purposes the data conform to the different revisions of the International Classification of Diseases (ICD), namely:

- ICD 7 1964–67
- ICD 8 1968–78
- ICD 9 1978 to the present

Documentation is available detailing the relationship between the ninth revision of the ICD and earlier revisions (ICD 7 & ICD 8). Detailed data tables excluded from the national cause of death publication since 1984 are available on microfiche or through our special data service.

- State or Territory of registration of the death
- Month and year of registration of the death
- Place of usual residence of deceased
 - State or Territory
 - Statistical Division
 - Statistical Local Area
- Occupation of deceased
 - From 1990
 - Males and Females aged 15 years and over
 - Pre-1990
 - Males aged 15–64 years only
 - 1985–90
 - Females aged 15–59 years only
- Sex of deceased
- Age of deceased
 - in completed days at under one week
 - in completed days at under one month
 - in completed months at under one year
 - in completed years at other ages
- Date of death of deceased
- Country of birth of deceased
- Duration of residence in Australia (where deceased is not Australian born)
- Marital status of deceased
- Number of issue of deceased
- Aboriginality (for all States except Queensland)
- Post-mortem indicator
- Drowning indicator (from 1992)
- AIDS indicator (where AIDS is mentioned on the Death Certificate, whether the underlying cause or not)
- Certifier of cause of death (Doctor or Coroner)
- Cancer indicator (where Cancer is mentioned on the Death Certificate, whether the underlying cause or not)

TABLES ON MICROFICHE

Table	Description
UR1	Deaths by State/Territory of usual residence by cause of death (S list) by sex by five year age groups.
UR2	Deaths by State/Territory of usual residence by cause of death (ICD-3 digit) by sex.
UR3	Deaths by State/Territory of usual residence by cause of death (ICD-3 digit) by sex by five year age groups
RG1	Deaths by State/Territory of registration by cause of death (S list) by sex by five year age groups
RG2	Deaths by State/Territory of registration by cause of death (ICD-3 digit) by sex
RG3	Deaths by State/Territory of registration by cause of death (ICD-3 digit) by sex by five year age groups

**STANDARD CAUSE OF
DEATH TABLES**

<i>Table</i>	<i>Description</i>
COD 1	Causes of death (ICD-3 digit) by age by sex by State/Territory of usual residence

Chronic obstructive pulmonary disease and allied conditions (including asthma, emphysema and bronchitis) (490–496)	27 098	159	3.0
Chronic liver disease and cirrhosis (571)	15 692	92	1.7
Diabetes mellitus (250)	13 157	77	1.5
Diseases of arteries, arterioles and capillaries (including atherosclerosis and aortic aneurysm) (440–448)	8 153	48	0.9
Hereditary and degenerative diseases of the central nervous system (330–337)	8 199	48	0.9
Pneumonia and influenza (480–487)	8 015	47	0.9

¹ Years of potential life lost standardised for age.

² Number of years per 100,000 mid-year population aged 1 to 75 years.

Estimates of years of potential life lost (YPLL) were calculated for deaths of persons aged 1–75 years based on the assumption that deaths occurring between ages 1 and 76 years are considered untimely.

$$YPLL = \sum_x (D_x (76 - A_x))$$

A_x = adjusted age at death. As age at death is only available in completed years the midpoint of the reported age was chosen (eg. age at death 34 years was adjusted to 34.5)

D_x = registered number of deaths at age x due to a particular cause of death

YPLL was standardised for age using the following formula:

$$YPLL_s = \sum_x (D_x (76 - A_x) C_x)$$

where the age correction factor C_x is defined for age x as:

$$C_x = \frac{N_{xs}}{N_s} \cdot \frac{1}{N_x} \cdot N$$

N = number of persons aged 1–75 years in the 1994 population

N_x = number of persons aged x years in the 1994 population

N_{xs} = number of persons aged x years in the standard population

N_s = number of persons aged 1–75 years in the standard population

The Australian population at 30 June 1991 was chosen as the standard population.

GLOSSARY

Adjusted births	Registered births adjusted by removing all stillbirths and neonatal deaths where birthweight was known to be less than 500 grams, used as the denominator population in calculating perinatal death rates in this publication. This adjustment is made in order to enable meaningful perinatal death rates to be calculated, in line with WHO recommendations. See paragraph 4 of the Explanatory Notes.
Death rates	Four forms of death rate are shown in the general deaths section in this publication. These are crude death rates, standardised death rates, age-specific death rates and infant death rates, as defined below:
	<ul style="list-style-type: none">▪ <i>crude death rates</i> relate to the total number of deaths for specific causes and are the number of deaths for those causes per 100,000 of the estimated mean resident population for the year ended 31 December — see Tables 1, 3 and 14 (total all ages only);▪ <i>standardised death rates</i> relate to the overall death rates that would have prevailed in a standard population if it had experienced at each age the death rates of the population being studied. The standard population used in these calculations is the 1991 Australian population;▪ <i>age-specific death rates</i> relate to deaths for age groups other than under 1 year and are the number of deaths per 100,000 of the mid-year estimated resident population in a particular age-sex group — see tables 3 and 14; and▪ <i>infant death rates</i> relate to deaths of children under one year of age and are the number of deaths per 1,000 births in the year — see tables 3 and 14.
	For comparison and measuring purposes, perinatal deaths in this publication have also been expressed as rates. These rates are defined as follows:
	<ul style="list-style-type: none">▪ for fetal deaths and total perinatal deaths, the rates represent the number of deaths per 1,000 live births and fetal deaths combined (where birthweight was at least 500g); and▪ for neonatal deaths, the rates represent the number of deaths per 1,000 live births (where birthweight was at least 500g).
Fetal death	A fetal death is the delivery of a child who did not, at any time after delivery, breathe or show any other evidence of life such as a heartbeat. (A birthweight criterion applies. See paragraphs 4–6 of the Explanatory Notes).
Infant death	The death of a child before its first birthday.
Live births	A live birth is the birth of a child who after delivery, breathes or shows any other evidence of life such as a heartbeat. (A birthweight criterion applies. See paragraphs 4–6 of the Explanatory Notes).
Neonatal death	A neonatal death is the death within 28 days of birth of any child who after delivery, breathed or showed any other evidence of life such as a heartbeat. (A birthweight criterion applies. See paragraphs 4–6 of the Explanatory Notes).
Perinatal death	A perinatal death is a fetal death or neonatal death. (A birthweight criterion applies. See paragraph 4–6 of the Explanatory Notes).

Period of gestation	Period of gestation is measured from the first day of the last normal menstrual period to the date of birth and is expressed in completed weeks.
Stillbirth	See Fetal death, above.
Years of potential life lost (YPLL)	YPLL measures the extent of 'premature' mortality, where 'premature' mortality is assumed to be any death at ages of 1–75 years inclusive. By estimating YPLL for deaths of people aged 1–75 years it is possible to assess the significance of specific diseases or trauma as a cause of premature death. See Technical Note — Years of Potential Life Lost on page 68 for an explanation of the calculation of YPLL.
