MAIN FEATURES

Permanent Movement

9,220 settler arrivals were recorded in February 1987, 28% more than in February 1986.

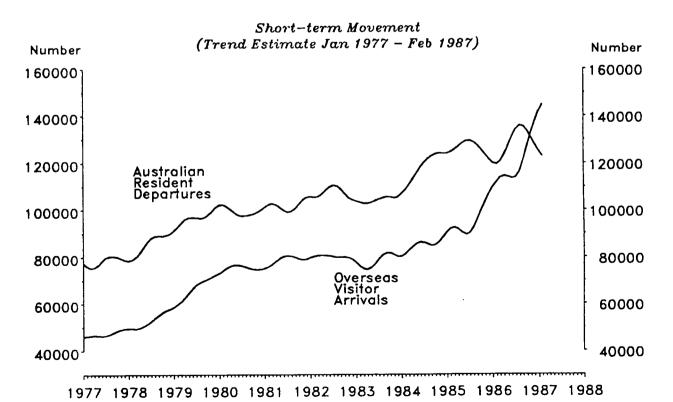

Arrivals of overseas visitors and departures of Australian residents for short-term visits

The trend estimate continues to show a sharp increase in the number of arrivals of visitors to Australia and a decline in the number of departures of Australian residents for short-term visits. The trend estimate of short-term arrivals of visitors continues to exceed that of short-term departures of Australian residents.

In February 1987, the actual number of short-term arrivals of visitors recorded was 147,800, 25% more than in February 1986.

Residents of four countries made up 60% of all short-term arrivals of visitors — U.S.A. (20%), New Zealand (14%), U.K. and Ireland (13%), and Japan (13%). The principal purposes of visits were — holiday (52%), visiting relatives (17%) and business (11%). A large proportion of visitors intended to stay in Australia for less than two weeks — 48% in February 1987.

The actual number of short-term departures of Australian residents recorded in February 1987 was 85,500, 7% more than in February 1986. The principal countries of visit were — New Zealand (23%), U.S.A. (11%), U.K. and Ireland (9%) and Indonesia (8%). The main purposes of journey were — holiday (49%), business (20%) and visiting relatives (15%). The proportion of Australian residents who intended to stay overseas for less than two weeks was 33% in February 1987, which is lower than the corresponding proportion of 48% for visitors.

EXPLANATORY NOTES

Introduction

This series of publications contains statistics of overseas arrivals and departures in summary form for the latest available month during which the movement occurred. More detailed statistics can be made available, on request, in unpublished form.

The statistics in this publication relate to the number Scope of movements rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, of transit passengers who pass through Australia but are not cleared for entry, and of passengers on pleasure cruises commencing and finishing in Australia aboard ships not then engaged on regular voyages.

Definitions

Category of movement

Category of movement is primarily determined by the traveller's selection of his or her own category on the passenger card. This selection is accepted provided it is consistent with other information on the passenger card.

Permanent movement

Permanent arrivals (settlers) comprise travellers who hold migrant visas (regardless of stated intended period of stay), New Zealand citizens who indicate an intention to settle, and those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens). Permanent departures are Australian residents (including former settlers) who on departure state they do not intend to return to Australia.

Long-term movement

Long-term arrivals comprise overseas visitors (except those who hold migrant visas—see paragraph 4 above) who intend to stay in Australia for 12 months or more and Australian residents returning after an absence of 12 months or more overseas. Long-term departures comprise Australian residents who intend to stay abroad for 12 months or more and overseas visitors departing who stayed 12 months or more in Australia.

Short-term movement

- Movements of travellers whose intended or actual length of stay is less than twelve months are classified as short-term, except those who on arrival hold migrant visas (see paragraph 4 above).
- A significant number of travellers state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. To maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one

year exactly are randomly allocated to long-term or short-term, in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.

Country of birth or residence

- The grouping of countries into regions in Asia in Table 2 is based on United Nations' classification of world regions. Applying this classification, the region which includes most 'middle east' countries is included in Asia and is called 'Western Asia (Middle East)'. The Appendix to the December 1985 issue of this publication contains a detailed list of countries included in the various regions of Asia.
- Statistics on country of birth or residence have certain limitations because of inadequate reporting on passenger cards. For instance, it is not possible to make a distinction between Northern Ireland and the Republic of Ireland, or to separately identify England, Scotland and Wales. Similarly 'Germany' could refer to the Federal Republic or to the Democratic Republic.

Estimation method

- 10. Overseas arrival and departure statistics are derived from a combination of full enumeration and sampling. All movements by sea regardless of duration of stay, all permanent movements and all movements with a duration of stay of more than one year are fully enumerated and processed. All movements by air with a duration of stay of one year or less are sampled and statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed.
- 11. The statistics in this publication have been rounded to the nearest 100 for short-term movements and to the nearest 10 for permanent and long-term movements. In tables showing both short-term and permanent and longterm movements the total movements have been rounded to the nearest 100. The sums of the components may, due to rounding, not add exactly to totals.

Corrections and imputations

- The imprecision due to sampling errors should not be confused with errors arising from imperfections in reporting, which may occur in any data collection, whether sampled or not. Every effort is made to minimise such errors, both through careful design of the passenger cards and through checks on the information once it is received. During the edit process some items are corrected where they conflict with other known information. Missing replies to certain items such as age and country of birth are also imputed by reference to other related items.
 - 13. Errors of this kind differ from discrepancies arising from the fact that certain information reflects the travellers intentions at the time the passenger cards were completed. These intentions are of course subject to change. Particularly affected are the distinction between permanent and temporary movement and in the latter case, length of intended stay, country in which most time will be spent and purpose of journey.

Seasonal adjustment

- 14. Original and seasonally adjusted short-term overseas visitor arrivals and short-term Australian resident departures are shown in Table 1. In the seasonally adjusted series, account has been taken of normal seasonal factors and 'trading day' effects (arising from the varying numbers of Sundays, Mondays, Tuesdays, etc. in the month) and the effect of movement in the date of Easter which may in successive years, affect figures for different months.
- 15. Seasonal adjustment may be carried out by various methods and the results may vary slightly according to the procedure adopted. Accordingly, seasonally adjusted statistics should not be regarded as in any way definitive. In interpreting particular seasonally adjusted statistics it is important to bear in mind the methods by which they have been derived and the limitations to which the methods used are subject.
- 16. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series may be more clearly recognised. Seasonal adjustment procedures do not aim to remove the irregular or non-seasonal influences which may be present in any particular month, such as the effect of major sporting and cultural events, changes in airfares structure and fluctuation of \$A relative to other currencies. Irregular influences that are highly volatile can make it difficult to interpret the movement of the series even after adjustment for seasonal variation.
- 17. The seasonally adjusted series can, however, be smoothed to reduce the impact of the irregular component in the adjusted series. There are a number of ways of accomplishing this, depending on the intended uses of the smoothed series. If importance is attached to measuring the underlying change in the most recent periods, moving averages employing appropriate weighting patterns should be adopted; the choice of averaging technique will determine in part the degree of smoothness of the derived series. The longer the term of the moving average the longer is the time series affected by revisions resulting from more recent data. In order to ensure that the underlying trend-cycle of a series is reflected in the trend estimate series, the degree of smoothness alone cannot always be used as the sole criterion in determining which moving average is appropriate.
- 18. The trend estimate of short-term overseas visitor arrivals and short-term Australian resident departures statistics is shown in Table 1. The trend estimate has been derived by applying a 13-term Henderson-weighted moving average to the series.

19. While this technique enables smoothed data for the latest period to be produced, it does result in revisions to the smoothed series, principally, of recent months as additional observations become available. There may also be revisions as a result of the re-estimation of the seasonal factors. For further information concerning the smoothing process refer to an Information Paper A Guide to Smoothing Time Series — Estimates of "Trend" (1316.0).

Related publications

20. Comprehensive definitions and explanations, and detailed data are contained in:
