## MAIN FEATURES

During September 1987, 601,100 movements into and out of Australia were recorded. There were $\mathbf{3 0 3 , 1 0 0}$ arrivals ( $9 \%$ more than in September 1986) and 298,000 departures ( $29 \%$ more than in September 1986).

The trend estimates of both visitor arrivals and resident departures for short-term visits have been on the increase, with the estimates for visitor arrivals continuing to exceed those of resident departures.

## Permanent movement

In September 1987:

- 11,860 permanent settlers arrived in Australia, $\mathbf{3 9 \%}$ more than in September 1986.
- 1,560 permanent departures were recorded in August, $\mathbf{8 \%}$ more than in September 1986.

## Arrivals of visitors for short-term visits

- 128,000 arrivals of overseas visitors for short-term visits were recorded, 35\% more than in September 1986.
- New Zealand was the major source of visitors (30\% of all visitors) followed by the U.S.A. (17\%), Japan (14\%) and the U.K. (7\%).
- Arrivals from Japan almost doubled from 9,800 in September 1986 to $17,400$.
- Arrivals from the U.S.A. numbered $22,100,38 \%$ more than in September 1986.
- The majority of short-term visits were for durations of less than one month ( $\mathbf{7 4 \%}$ ), with $\mathbf{5 3 \%}$ for durations of less than 2 weeks.
- $65,400(51 \%)$ of arrivals were for the purpose of 'holiday', $\mathbf{2 3 , 4 0 0}$ (18\%) were for the purpose of 'visiting relatives', and 16,700 ( $13 \%$ ) for 'business'.

## Departures of Australian residents for short-term trips abroad

 In September 1987:- $\mathbf{1 6 5 , 4 0 0}$ departures of Australian residents for short-term overseas trips were recorded, $\mathbf{2 8 \%}$ more than in September 1986.
- The most popular overseas destinations were New Zealand ( $16 \%$ ), the U.S.A., and the U.K. ( $13 \%$ each), Indonesia (7\%) and Hong Kong (6\%).
- Departures to the U.S.A. more than doubled from $\mathbf{1 0 , 8 0 0}$ in September 1986 to 21,700 in September 1987.
- The majority of departures were for durations of less than one month ( $67 \%$ ), with $\mathbf{3 3 \%}$ for durations of less than two weeks.
- 98,600 ( $60 \%$ ) of departures were for the purpose of 'holiday', 27,700 (17\%) for 'visiting relatives', and 22,800 (14\%) for 'business'.

SHORT-TERM MOVEMENT: TREND ESTIMATE

## EXPLANATORY NOTES

## Introduction

This series of publications contains statistics of overseas arrivals and departures in summary form for the latest available month during which the movement occurred. More detailed statistics can be made available, on request, in unpublished form.

## Scope

2. The statistics in this publication relate to the number of movements rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, of transit passengers who pass through Australia but are not cleared for entry, and of passengers on pleasure cruises commencing and finishing in Australia aboard ships not then engaged on regular voyages.

## Definitions

## Category of movement

3. Category of movement is primarily determined by the traveller's selection of his or her own category on the passenger card. This selection is accepted provided it is consistent with other information on the passenger card.

## Permanent movement

4. Permanent arrivals (settlers) comprise travellers who hold migrant visas (regardless of stated intended period of stay), New Zealand citizens who indicate an intention to settle, and those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens). Permanent departures are Australian residents (including former settlers) who on departure state they do not intend to return to Australia.

## Long-term movement

5. Long-term arrivals comprise overseas visitors (except those who hold migrant visas-see paragraph 4 above) who intend to stay in Australia for 12 months or more and Australian residents returning after an absence of 12 months or more overseas. Long-term departures comprise Australian residents who intend to stay abroad for 12 months or more and overseas visitors departing who stayed 12 months or more in Australia.

## Short-term movement

6. Movements of travellers whose intended or actual length of stay is less than twelve months are classified as short-term, except those who on arrival hold migrant visas (see paragraph 4 above).
7. A significant number of travellers state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. To maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term, in proportion to the number of movements of
travellers who report their actual length of stay as up to one month more, or one month less, than one year.

## Country of birth or residence

8. The grouping of countries into regions in Asia in Table 2 is based on United Nations'classification of world regions. Applying this classification, the region which includes most 'middle east' countries is included in Asia and is called 'Western Asia (Middle East)'. The Appendix to the December 1985 issue of this publication contains a detailed list of countries included in the various regions of Asia.
9. Statistics on country of birth or residence have certain limitations because of inadequate reporting on passenger cards. For instance, it is not possible to make a distinction between Northern Ireland and the Republic of Ireland, or to separately identify England, Scotland and Wales. Similarly 'Germany' could refer to the Federal Republic or to the Democratic Republic.

## Estimation method

10. Overseas arrival and departure statistics are derived from a combination of full enumeration and sampling. All movements by sea regardless of duration of stay, all permanent movements and all movements with a duration of stay of more than one year are fully enumerated and processed. All movements by air with a duration of stay of one year or less are sampled and statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed. Details of the sampling method and comments on the sampling errors associated with the estimates are contained in the Technical Note, Appendix A.
11. The statistics in this publication have been rounded to the nearest 100 for short-term movements and to the nearest 10 for permanent and long-term movements. In tables showing both short-term and permanent and longterm movements the total movements have been rounded to the nearest 100 . The sums of the components may, due to rounding, not add exactly to totals.

## Corrections and imputations

12. The imprecision due to sampling errors should not be confused with errors arising from imperfections in reporting, which may occur in any data collection, whether sampled or not. Every effort is made to minimise such errors, both through careful design of the passenger cards and through checks on the information once it is received. During the edit process some items are corrected where they conflict with other known information. Missing replies to certain items such as age and country of birth are also imputed by reference to other related items.
13. Errors of this kind differ from discrepancies arising from the fact that certain information reflects the travellers intentions at the time the passenger cards were completed. These intentions are of course subject to change. Particularly affected are the distinction between permanent and temporary movement and in the latter case, length of intended stay, country in which most time will be spent and purpose of journey.

## Seasonal adjustment

14. Original and seasonally adjusted short-term overseas visitor arrivals and short-term Australian resident departures are shown in Table 1. In the seasonally adjusted series, account has been taken of normal seasonal factors and 'trading day' effects (arising from the varying numbers of Sundays, Mondays, Tuesdays, etc. in the month) and the effect of movement in the date of Easter which may in successive years, affect figures for different months.
15. Seasonal adjustment may be carried out by various methods and the results may vary slightly according to the procedure adopted. Accordingly, seasonally adjusted statistics should not be regarded as in any way definitive. In interpreting particular seasonally adjusted statistics it is important to bear in mind the methods by which they have been derived and the limitations to which the methods used are subject.
16. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series may be more clearly recognised. Seasonal adjustment procedures do not aim to remove the irregular or nonseasonal influences which may be present in any particular month, such as the effect of major sporting and cultural events, changes in airfares structure and fluctuation of \$A relative to other currencies. Irregular influences that are highly volatile can make it difficult to interpret the movement of the series even after adjustment for seasonal variation.
17. The seasonally adjusted series can, however, be smoothed to reduce the impact of the irregular component in the adjusted series. There are a number of ways of accomplishing this, depending on the intended uses of the smoothed series. If importance is attached to measuring the underlying change in the most recent periods, moving averages employing appropriate weighting patterns should be adopted; the choice of averaging technique will determine in part the degree of smoothness of the derived series. The longer the term of the moving average the longer is the time series affected by revisions resulting from more recent data. In order to ensure that the underlying trend-cycle of a series is reflected in the trend estimate series, the degree of smoothness alone cannot always be used as the sole criterion in determining which moving average is appropriate.
18. The trend estimate of short-term overseas visitor arrivals and short-term Australian resident departures statistics is shown in Table 1. The trend estimate has been derived by applying a 13 -term Henderson-weighted moving average to the series.
19. While this technique enables smoothed data for the latest period to be produced, it does result in revisions to the smoothed series, principally, of recent months as additional observations become available. There may also be revisions as a result of the re-estimation of the seasonal factors. For further information concerning the smoothing process refer to an Information Paper $A$ Guide to Smoothing Time Series - Estimates of "Trend" (1316.0).

## Related publications

20. Comprehensive definitions and explanations, and detailed data are contained in:

Overseas Arrivals and Departures, Australia (3402.0)issued quarterly

## Overseas Arrivals and Departures, Ausiralia (3404.0)issued annually

21. Current publications produced by the ABS are listed in the Catalogue of Publications, Australia (1101.0). The ABS also issues, on Tuesdays and Fridays, a Publications Advice (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

## Symbols and other usages

- nil or rounded to zero
. . not applicable
* subject to sampling variability too high for most practical purposes

## APPENDIX A

## TECHNICAL NOTE : METHOD OF SAMPLING AND RELIABILITY OF ESTIMATES

## Method of sampling

All movements by air with a duration of stay less than one year are sampled using the following stratification:

## Country of Citizenship

Australia and New Zealand
U.S.A., U.K., Ireland

Canada or Japan
Any other individual country

## Sample

3 in 100
5 in 100
10 in 100
25 in 100

## Reliability of estimates

Estimates based on a sample are subject to sampling variability, i.e. they may differ from those that would be obtained from a full enumeration.

The sampling error associated with any estimate can be estimated from the sample results and one measure so derived is the standard error. Given an estimate and the standard error on that estimate, there are about two
chances in three that the sample estimate will differ by less than one standard error from the figure that would have been obtained from full enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors. Another measure of the sampling error is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate.

It would be impracticable to publish estimates of standard errors for all figures in individual tables. However, the following table of standard errors and relative standard errors gives an indication of the magnitude of the sampling error associated with any estimate of a particular size for short-term and total movement. Long-term movement is subject to some sampling in that some movements of one year's duration (which are sampled) are allocated to the long-term category. The numbers involved, however, are small and resultant sampling errors associated with figures of long-term movement are negligible.

APPROXIMATE STANDARD ERRORS OF ESTIMATES FOR STRATIFIED SAMPLE

| Estimated number of persons | Short-term movement |  |  |  | Total movement |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Departure or arrival of Australian residents |  | Arrival or departure of overseas visitors |  | Arrivals or departures |  |
|  | Standard error | Relative standard error | Standard error | Relative standard error | Standard error | Relative standard error |
|  |  | \% |  | \% |  | \% |
| 10,000 | 500 | 5 | 330 | 3 | 500 | 5 |
| 5,000 | 400 | 8 | 220 | 4 | 350 | 7 |
| 2,000 | 250 | 13 | 154 | 8 | 200 | 11 |
| 1,000 | 180 | 18 | 99 | 10 | 150 | 15 |
| 750 | 160 | 21 | 91 | 12 | 130 | 17 |
| 500 | 120 | 25 | 71 | 14 | 100 | 21 |
| 400 | 110 | 29 | 66 | 16 | 93 | 23 |
| 300 | 97 | 32 | 56 | 19 | 80 | 27 |
| 200 | 80 | 40 | 46 | 23 | 65 | 32 |
| 100 | 57 | 57 | 33 | 33 | 47 | 47 |

An example of the use of this table is as follows: if the estimate of the number of Australian resident departures for short-term visits is 500 , then the standard error on this estimate is 120 , i.e. there are two chances in three that the actual number of Australian resident departures for a short-term visit will lie between 380 and 620 and nineteen chances in twenty that it will lie between 260 and 740 .

As the table shows, the larger the size of an estimate the smaller the relative standard error. For any estimate of greater than 10,000 the relative standard error will be less than 5 per cent and so the sampling error can be assumed to be negligible for most practical purposes.

The estimate of the difference between an estimate in two different periods or between estimates from the same period is also subject to sampling error. The standard
error on the difference between any two estimates which are subject to sampling error can be approximated by using the larger standard error of the estimates inflated by a factor of 1.4. An example of the use of this procedure is as follows:

Assume the estimates of the number of arrivals to Australia of visitors who stated 'attending convention' as the purpose of journey in July 1986 and 1987 are 1,500 and 900 respectively. The difference between the 1986 and the 1987 figures is 600 and the standard errors on these estimates are approximately 126 and 96 . The standard error on the difference is approximately $(1.4 \times 126)=176$, and there are nineteen chances in twenty that the estimate of the difference between the two years will lie between 248 and 952.
