NOTES ON THE JUNE QUARTER ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage points Contribution to Growth in GDP	
	Mar. qtr 1982 to June qtr 1982	June qtr 1981 to June qtr 1982	Mar. qtr 1982 to June qtr 1982	June qtr 1981 to June qtr 1982
Final consumption expenditure—				
Private	0.2	3.3	0.1	2.0
Government	4.0	3.6	0.6	0.6
Gross fixed capital expenditure	-1.6	0.6	-0.4	0.2
Increase in stocks	-1.0	0.4
Statistical discrepancy	1.9	0.6
Gross national expenditure	1.3	3.6	1.4	3.7
Exports of goods and services	1.1	3.4	0.2	0.6
Imports of goods and services	2.8	10.4	-0.6	-2.1
Gross domestic product	1.0	2.2	1.0	2.2
Gross farm product	2.0	19.9	0.1	1.1
Gross non-farm product	0.9	1.2	0.8	1.1

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 4.1 per cent in June quarter 1982, while gross operating surplus of trading enterprise companies rose by 10.0 per cent after falling by 9.3 in the March quarter 1982.

The following notes are provided to aid analysis of the estimates for recent quarters.

Gross operating surplus-companies

The gross operating surplus of companies is obtained by deducting the stock valuation adjustment (SVA) from an estimate of the profits of companies which, for the quarters of the latest year, are calculated using data obtained from the profits survey conducted by the ABS. The magnitudes of the fall in gross operating surplus of companies in March quarter 1982 and of its rise in June quarter 1982 should be interpreted in the light of the discussion below concerning the SVA.

Stock valuation adjustment

The size of the stock valuation adjustment (SVA) in March quarter 1982 increased substantially compared with December 1981 and remained at a relatively high level during June quarter 1982. The reason for this is that the rate of price increase for most commodities has accelerated during the last two quarters. However, it is

possible that the size of the SVA could be overstated in March quarter and underestimated in June quarter because of the assumptions (particularly (a) and (b) below) used in compiling estimates of the SVA. The major assumptions are that:

- (a) book value levels reported by businesses are based on accounting valuations at historical cost assigned by the FIFO (first in, first out) method;
- (b) within most sectors, sales prices can be used to adjust stock levels valued at cost, that is, the selling price of finished goods is established as a fixed mark-up on the costs incurred in the current period;
- (c) the commodities in stock have a fixed turnover period, that is, the ratios 'stock level of materials/value of purchases' and 'stock level of finished goods/value of sales' remain constant;

- (d) the commodity composition of each estimation cell remains fixed; and
- (e) within each estimation cell, the RATE of physical increase (or decrease) in stocks is constant throughout each quarter.

In times of rapid price change and/or marked changes in the rate of price increase, inconsistencies between these assumptions and actual business practice can lead to significant errors in the SVA. Movements in the size of the SVA affect the rate of change in gross domestic product. However, because the SVA is deducted from both sides of the domestic production account, errors in its measurement have no impact on the size of the statistical discrepancy.

Government final consumption expenditure

The implicit price deflator (IPD) for this aggregate increased sharply in the June quarter 1982. The main reasons were increases in NSW and Victorian teachers' salaries effective from 1 January 1982 and paid during June quarter 1982. Constant price estimates aim to exclude back-dated increases of this kind, which therefore show up in the IPD. In addition, there was a rise in the general State Award for Queensland government employees and pay increases for health and welfare workers in South Australia.

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters and indicates that inconsistencies in the recording of transactions in the domestic production account are particularly marked in some quarters. Users are advised to take these problems into account when interpreting the estimates.

PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

<i>Quarters ended</i>	<i>Income-based(a)</i>	<i>Expenditure-based(b)</i>
<i>1981—</i>		
March	0.6	-0.5
June	0.7	—
September	1.0	2.2
December	-0.8	0.3
<i>1982—</i>		
March	—	-0.7
June	0.9	-1.2

(a) Gross non-farm product as published.

(b) Gross non-farm product less statistical discrepancy.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the June quarter was 87.0 per cent while household saving which is derived as a balancing item represented 13.0 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
<i>1981—</i>	
March	11.5
June	13.2
September	13.0
December	13.5
<i>1982—</i>	
March	12.2
June	13.0

Revisions

Estimates for all aggregates have been revised in accordance with the annual estimates published in Budget Paper No. 10, *National Income and Expenditure, 1981-82* (5213.0). The major revisions to estimates of quarterly movements in 1981-82 were in respect of gross fixed capital expenditure of public enterprises in the September quarter; imports of goods and services at constant prices in the September and March quarters; wages, salaries and supplements in the December quarter; and private non-farm stocks and gross operating surplus of companies in the March quarter.

From the December quarter, estimates of private wages and salaries have been based on an interim sample survey of employers. Revisions to the wages, salaries and supplements series for December and March quarters were mainly the result of revised information concerning pay-day adjustment factors and revisions to the survey estimates. The main impact of these revisions on the seasonally adjusted series was to the December quarter movement.

Since the release of the March quarter estimates the following series have been seasonally reanalysed:

- 'travel' component of imports of goods and services at both current and constant prices
- 'travel' component of exports of goods and services at both current and constant prices
- wages, salaries and supplements
- interest received by households
- gross non-farm product at constant prices.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the June quarter 1982, together with comparative estimates for the eight previous quarters and the four years 1978-79 to 1981-82. Initial estimates for the June quarter were published on 17 August in *Quarterly Estimates of National Income and Expenditure, June Quarter 1982 (Preliminary)* (5205.0). Those estimates have not been revised but additional details are contained in this publication. Tables 32-42 provide historical series for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

2. Apart from the change discussed in paragraph 3 of the Explanatory notes to the March quarter 1982 issue of this publication, the definitions and concepts used are identical to those employed in *Australian National Accounts, National Income and Expenditure 1980-81* (5204.0). A discussion of these definitions and concepts, the nature and limitations of implicit price deflators and a description of items in this publication are presented in *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures

GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$31 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1982* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter. As far as possible the constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

11. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t)-A(t-1)}{\text{GDP } (t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP (t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

12. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

13. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

14. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

Related publications

15. In addition to those mentioned above other ABS publications which may be of interest include:

Historical Series of Quarterly Estimates of National Income and Expenditure, Australia, (5207.0)-issued for December Quarter only

Australian National Accounts, Gross Product by Industry at Current and Constant Prices, 1980-81 (Preliminary) (5210.0)

Australian National Accounts, Gross Product by Industry at Current and Constant Prices, 1979-80 (5211.0)

Budget Paper: National Income and Expenditure, 1981-82 (5213.0)

16. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
