NOTES ON THE ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory notes under interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage Points Contribution to Growth in GDP	
	Mar. qtr 1984 to June qtr 1984	June qtr 1983 to June qtr 1984	Mar. qtr 1984 to June qtr 1984	June qtr 1983 to June qtr 1984
Final consumption expenditure—				
Private	0.2	3.6	0.1	2.3
Government	-1.5	4.6	-0.3	0.8
Gross fixed capital expenditure	0.8	3.6	0.2	0.8
Increase in stocks	—	3.7
Statistical discrepancy	2.3	3.0
Gross national expenditure	2.4	10.4	2.4	10.6
Exports of goods and services	5.0	19.2	0.9	3.2
Imports of goods and services	5.2	20.4	-1.0	-3.7
Gross domestic product	2.3	10.1	2.3	10.1
Gross farm product	4.5	45.2	0.3	2.2
Gross non-farm product	2.1	8.3	2.0	7.9

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 5.8 per cent in June quarter 1984, following a rise of 0.6 per cent in the previous quarter, while gross operating surplus of trading enterprise companies fell 0.4 per cent after rising by 19.1 per cent in the March quarter 1984.

The following notes are provided to aid analysis of the estimates for recent quarters.

Medicare

The introduction of the Medicare system of payment for hospital and medical expenses from 1 February 1984 has a direct impact on a number of aggregates in the accounts. As a result of the new health care financing arrangements, income taxes paid by individuals, government final consumption expenditure and personal benefit payments made to households will all be higher, while private final consumption expenditure on health will be marginally lower than would otherwise have been the case. The changes in these aggregates are respectively:

- the medicare levy;
- public hospital expenses previously charged to individuals that are now met directly by governments;
- amounts paid by Medicare for individual hospital and medical services; and
- the payments previously made by individuals to public hospitals.

Movements in the implicit price deflator (IPD) of private final consumption expenditure are generally fairly similar to movements in the consumer price index (CPI). However, in March quarter 1984 the IPD rose by 1.4 per cent while the 'All groups' CPI fell by 0.4 per cent

and in June quarter 1984 the IPD rose by 1.3 per cent while the 'All groups' CPI rose by only 0.2 per cent. The major reason for these divergencies is that private final consumption expenditure includes all charges for individual hospital and medical services, whether or not they are paid directly by households, whereas the CPI measures net prices actually paid by households for hospital and medical services.

Wages, salaries and supplements

Until September quarter 1981 estimates of wages, salaries and supplements were mainly based on payroll tax data. From December quarter 1981 the estimates have been based on sample surveys of employers. A small interim survey was introduced from December quarter 1981 until a full-scale Survey of Employment and Earnings (SEE) could be established. That survey (SEE) has operated since September quarter 1983 and has been taken into account in the earnings estimates in this publication. The employment coverage of both sets of survey estimates has been adjusted to reflect movements in the number of wage and salary earners shown in the monthly Labour Force Survey.

A small survey of pay periodicity was conducted in respect of September quarter 1981 in order to assist in estimating the effects of changes in the seasonal pattern between the payroll tax data underlying the series prior to December quarter 1981 and the interim survey data underlying the series from December quarter 1981. Because of the limited nature of the data that was obtained in that survey, extra caution is required in interpreting the seasonally adjusted estimates since December quarter 1981. These seasonally adjusted estimates may be revised in the light of more comprehensive data which is planned to be collected in a pay periodicity survey to be conducted in respect of September quarter 1984.

Gross operating surplus—Trading enterprise companies

As indicated in the main features box, estimates for this aggregate are subject to revision as firmer data come to hand. Given the large movements presently estimated for this aggregate over the past two years and the extent of divergence among sources of information used in its estimation, the scope for revision is greater than usual.

Government final consumption expenditure

The implicit price deflator of this aggregate rose by 3.3 per cent in June quarter 1984. The main reason for the relatively large rise is the national wage case decision which increased wages by 4.1 per cent with effect from early April 1984.

Gross fixed capital expenditure—Sales of public sector assets

The national accounts attribute gross fixed capital expenditure to sectors on the basis of legal ownership, a basis consistent with existing Australian accounting practices.

The following table provides information on major sales of fixed assets from the public sector to the private sector. Because the vast majority of these sales are associated with leaseback or similar arrangements this data can be used to partially adjust capital expenditure estimates from sector of legal ownership to sector of effective ownership. However, it should be noted that such an adjustment would not take into account all arrangements under which assets owned by the private sector are effectively controlled by the public sector. Also, it would result in estimates of capital expenditure inconsistent with estimates of gross operating surplus and other aggregates in the sector accounts, for which information is not available to make estimates on other than the present basis.

MAJOR SALES OF FIXED ASSETS FROM THE PUBLIC SECTOR TO THE PRIVATE SECTOR (EXCLUDING DWELLINGS)

	<i>Non dwelling construction (\$ million)</i>	<i>Equipment (\$ million)</i>	<i>Total (\$ million)</i>
1980-81	—	185	185
1981-82	81	1216	1297
1982-83	98	851	949
1983-84	151	1120	1271
<i>1982—</i>			
September	n.p.	n.p.	117
December	n.p.	n.p.	208

MAJOR SALES OF FIXED ASSETS FROM THE PUBLIC SECTOR TO THE PRIVATE SECTOR (EXCLUDING DWELLINGS)—continued

	<i>Non dwelling construction (\$ million)</i>	<i>Equipment (\$ million)</i>	<i>Total (\$ million)</i>
<i>1983—</i>			
March	n.p.	n.p.	367
June	n.p.	n.p.	257
September	n.p.	n.p.	104
December	n.p.	n.p.	523
<i>1984—</i>			
March	n.p.	n.p.	110
June	n.p.	n.p.	534

Gross fixed capital expenditure—Equipment

The implicit price deflator of this aggregate rose by 2.9 per cent in June quarter 1984 after a fall of 2.0 per cent in March quarter. The main reason for these changes was a sharp increase in the imported equipment share of total equipment in March quarter followed by a decline in the proportion attributable to imported equipment in June quarter. The effect of these compositional shifts was to lower the level of the deflator for equipment in March quarter and raise it in June quarter, with the movements being reinforced by the impact on import prices of an appreciating \$A in March quarter followed by a decline in the value of the \$A during June quarter.

Exports of goods and services

The implicit price deflator (IPD) for exports of goods and services fell by 0.8 per cent during June quarter 1984 as a result of a decline of 1.1 per cent in the IPD of the goods component. The main reason for the decrease in the goods IPD was a substantial rise in the share of sugar within total goods. In the absence of compositional changes the IPD of goods would have increased by 0.5 per cent.

Stocks

In seasonally adjusted terms, private non-farm stocks at constant prices recorded an *increase* for the second successive quarter following five quarters of very large run-downs. However, the stock buildup was less than in March quarter 1984. The result of this smaller buildup in non-farm stocks was a *negative contribution of 0.2 percentage points to growth* in gross domestic product (GDP) in June quarter 1984. (See paragraph 12 of the Explanatory notes for details of how the contributions of individual aggregates to the overall growth in GDP are calculated.)

Despite the buildup in stocks that has occurred in the past two quarters, the constant price private non-farm stocks to sales(a) ratio has declined to the lowest level recorded in the quarterly national accounts. The private non-farm stocks to sales ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Ratio</i>
<i>1983—</i>	
March	0.761
June	0.741
September	0.716
December	0.690
<i>1984—</i>	
March	0.695
June	0.682

(a) Constant price sales are defined as gross non-farm product *plus* imports of goods and services (excluding petroleum, civil aircraft and government imports) *less* changes in private non-farm stocks. (All these variables are at average 1979-80 prices.)

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters.

PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

<i>Quarters ended</i>	<i>Income-based(a)</i>	<i>Expenditure-based(b)</i>
<i>1983—</i>		
March	0.4	0.8
June	-1.3	-2.3
September	2.5	2.8
December	1.5	1.1
<i>1984—</i>		
March	1.9	1.7
June	2.1	-0.4

(a) Gross non-farm product as published. (b) Gross non-farm product *less* statistical discrepancy.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the June quarter was 85.1 per cent while household saving, which is derived as a balancing item, represented 14.9 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure.

The household saving ratio in recent quarters is as follows:

<i>Quarters ended</i>	<i>Percentage</i>
<i>1983—</i>	
March	13.4
June	12.7
September	13.3
December	14.2
<i>1984—</i>	
March	14.2
June	14.9

Revisions

Quarterly estimates have been revised as a result of annual (benchmark) revisions. The main series affected are:

- private gross fixed capital expenditure on equipment;
- public gross fixed capital expenditure; and
- gross operating surplus of companies.

Seasonally adjusted series shown in this issue incorporate the effects of some significant changes to the methods of seasonal adjustment used. The series affected are: increase in private non-farm stocks; private gross fixed capital expenditure (GFCE); and GFCE by public enterprises.

Prior to this issue, increase in stocks of private non-farm wholesalers and retailers was adjusted directly as a single series. Following the major variations which have occurred in the original series in recent years, the two components have now been analysed separately with the total of the two being derived by aggregating the seasonally adjusted components.

As mentioned above, movements in the original series for private and public GFCE have been significantly influenced since June quarter 1979 by the sale and lease-back of assets between public enterprises and the private sector. Improvements have been made to the seasonal adjustment of the following series: private GFCE—non-dwelling construction; private GFCE—equipment; public enterprises GFCE.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the June quarter 1984, together with comparative estimates for the eight previous quarters and the four years 1980-81 to 1983-84. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the June quarter 1984, together with comparative estimates for the twelve previous quarters. Tables 32-42 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators.

Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined in Appendix A, *Australian National Accounts, National Income and Expenditure, 1982-83* (5204.0).

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation of the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical

discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$33 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Tables 9 and 42 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22, 23, 33, 35 and 37 to 42, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary

to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

12. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution by each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{\text{GDP } (t-1)} \times 100.0$$

where $A(t)$ = value of aggregate A in quarter under consideration

$A(t-1)$ = value of aggregate A in preceding quarter

GDP $(t-1)$ = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

Related publications

16. In addition to those mentioned above other ABS publications which may be of interest include:

Historical Series of Estimates of National Income and Expenditure, Australia, (5207.0)—issued for December Quarter only

Australian National Accounts, Gross Product by Industry, 1981-82 (5211.0)

Budget Paper: National Income and Expenditure, 1983-84 (5213.0)

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
