NOTES ON THE ESTIMATES

MAIN FEATURES

NOTE: Changes in individual quarters are necessarily subject to the uncertainties discussed in the Explanatory notes under Interpretation of quarterly estimates, and furthermore some may be substantially revised as firmer data come to hand. This applies particularly to the estimates for the two most recent years for gross operating surplus, the income of companies and non-farm unincorporated enterprises, depreciation, and therefore to the estimated magnitude of change in gross non-farm product.

ESTIMATES OF MAIN AGGREGATES AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

	Percentage Change		Percentage Points Contribution to Growth in GDP	
	Dec. qtr 1984 to Mar. qtr 1985	Mar. qtr 1984 to Mar. qtr 1985	Dec. qtr 1984 to Mar. qtr 1985	Mar. qtr 1984 to Mar. qtr 1985
Final consumption expenditure—				
Private	2.0	4.0	1.2	2.4
Government	-0.2	3.3	—	0.6
Gross fixed capital expenditure	6.9	11.9	1.5	2.6
Increase in stocks—				
Private non-farm	-0.6	-0.2
Farm and public authority	-0.2	-0.3
Statistical discrepancy	-2.5	-0.2
Gross national expenditure	-0.5	4.9	-0.5	5.0
Exports of goods and services	1.7	8.1	0.3	1.4
Imports of goods and services	-3.6	10.5	0.8	-2.0
Gross domestic product	0.5	4.4	0.5	4.4
Gross farm product	1.5	-1.1	0.1	-0.1
Gross non-farm product	0.5	4.8	0.4	4.5

.. not applicable

In current price seasonally adjusted terms, wages, salaries and supplements rose by 0.6 per cent in March quarter 1985, following a rise of 1.9 per cent in the previous quarter, while gross operating surplus of trading enterprise companies rose 5.2 per cent after rising by 4.1 per cent in the December quarter 1984.

The following notes are provided to aid analysis of the estimates for recent quarters.

In examining movements between the December quarter 1984 and the March quarter 1985, the constant price estimates show widespread growth in the expenditure aggregates, with major contributions coming from private final consumption expenditure, public gross fixed capital expenditure and net overseas trade in goods and services. This growth in expenditure estimates is not matched on the income side, with the result that there is a large fall in the statistical discrepancy between December and March quarters.

The reasons for such a change in the discrepancy are not known; any or all of the many data sources could be involved. The most probable reasons are inconsistencies in the timing and valuation of stocks and exports and imports of goods and services.

The change on a year earlier also shows strong growth in private final consumption expenditure and gross fixed capital expenditure partly offset by a smaller addition to stocks and a negative contribution from overseas trade. Over this period the estimated change in aggregate incomes is similar to that in aggregate expenditures.

Implicit price deflators — major aggregates

The implicit price deflators (IPDs) for gross domestic product (GDP), gross non-farm product

(GNFP) and gross national expenditure (GNE) have moved erratically in recent quarters and do not appear to be providing accurate short-term measures of price change. They are derived by dividing a seasonally adjusted current price value by the corresponding seasonally adjusted constant price value. As derived measures, short term movements in IPDs are much more sensitive to any inconsistencies in the underlying estimates than are the estimates themselves.

In preparing the accounts every effort has been made to ensure consistency in the timing of flows between related aggregates. However, as discussed above, it is believed that estimates for the most recent quarters may be affected to a greater than usual extent by timing differences. Where such problems relate to items with disparate IPD levels (in particular, some of the major rural commodities), any significant inconsistencies can lead to distortions in the IPDs of higher level aggregates. Additionally, the independent seasonal adjustment of current price GNFP and constant price GNFP may lead to disturbances in the IPD for GNFP as well as in the IPDs for the dependent aggregates of GNE and GDP. Users are advised therefore to use more than usual caution when interpreting quarterly movements in aggregate IPDs.

Private gross fixed capital expenditure — equipment

The IPD for this aggregate fell by 0.1 per cent in the March quarter 1985. The imported share of capital equipment increased markedly from the December quarter 1984, giving a greater weight to the imported capital equipment IPD which has a lower level than the IPD for domestically produced capital equipment. Had there been no change in the relative proportions of these two components the aggregate IPD would have increased by 1.8 per cent. The depreciation of the \$A during the March quarter has not yet had any significant impact on the price indexes used to construct the deflator for equipment. It is believed however that there will be significant exchange rate effects underlying this deflator for next quarter.

Gross fixed capital expenditure — Sales of public sector assets

The national accounts attribute gross fixed capital expenditure to sectors on the basis of legal ownership. Since 1980-81 a number of major sales of public sector assets to the private sector on a sale/leaseback basis have occurred. For information regarding such transactions up to June quarter 1984 reference should be made to the September quarter 1984 issue of this publication - see 'Notes on the estimates' (page 1). No quantitative information is available yet concerning later quarters.

Stocks

In seasonally adjusted terms, private non-farm stocks at constant prices recorded a lower increase than in December quarter 1984, continuing the restocking which began in March quarter 1984. The increase in private non-farm stocks contributed -0.6 percentage points to growth in gross domestic product (GDP) in March quarter 1985.

Despite the build-up in stocks in recent quarters, the constant price private non-farm stocks to sales (a) ratio has remained fairly constant since December quarter 1983. The private non-farm stocks to sales ratio in recent quarters is as follows:

Quarters ended	Ratio
1983— December	0.683
1984— March	0.688
June	0.677
September	0.670
December	0.671
1985— March	0.676

(a) Constant price sales are defined as gross non-farm product plus imports of goods and services (excluding petroleum, civil aircraft and government imports) less changes in private non-farm stocks. (All these variables are at average 1979-80 prices.)

Statistical discrepancy

The statistical discrepancy represents the difference between the sum of the estimates of gross domestic product (GDP) and imports of goods and services on the one hand and the sum of the estimates of components of gross national expenditure and exports of goods and services on the other hand. Conceptually these two totals are the same. The inclusion of the statistical discrepancy on the expenditure side of the domestic production account is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components.

The aspect of the statistical discrepancy which is of most concern in the quarterly context is the magnitude of change from one quarter to the next. In some quarters there are quite

significant movements in the seasonally adjusted constant price statistical discrepancy. A useful way of examining the significance of the statistical discrepancy is to compare the change in gross non-farm product as published with the result which would be obtained using the expenditure aggregates excluding the statistical discrepancy. The following table shows such a comparison for the last 6 quarters.

PERCENTAGE CHANGES IN GROSS NON-FARM PRODUCT AT AVERAGE 1979-80 PRICES, SEASONALLY ADJUSTED

Quarters ended	Income -based(a)	Expenditure -based(b)
1983— December	2.0	—
1984— March	1.7	3.5
June	1.9	-0.9
September	0.7	0.6
December	1.7	2.1
1985— March	0.5	3.2

(a) Gross non-farm product as published. (b) Gross non-farm product less statistical discrepancy.

Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the March quarter was 83.4 per cent while household saving, which is derived as a balancing item, represented 16.6 per cent. Both of these ratios are affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure. A high proportion of the rise in the saving ratio in the March quarter is due to the impact of the Commonwealth public service dispute in the early part of 1985 on provisional tax collections.

The household saving ratio in recent quarters is as follows:

Quarters ended	Percentage
1983— December	15.1
1984— March	13.7
June	15.4
September	14.4
December	15.3
1985— March	16.6

Revisions

Significant revisions have been made to various farm sector aggregates for the December quarter. These revisions arose largely because a greater proportion of the 1984-85 wheat and barley crop was harvested in December quarter 1984 than previously estimated. In addition, revisions to several public authority series in both the September and December quarters 1984 have occurred. The major public sector aggregates affected are gross fixed capital expenditure by general government, public trading enterprises gross operating surplus and indirect taxes. Private gross fixed capital expenditure on equipment has also been revised as a result of revisions to estimates of net public sector sales of second-hand assets. Private sector gross fixed capital expenditure on dwellings has been revised up in December quarter 1984 following the incorporation of value of work done data from the Building Activity Survey.

EXPLANATORY NOTES

Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the March quarter 1985, together with comparative estimates for the eight previous quarters and the four years 1980-81 to 1983-84. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the March quarter 1985, together with comparative estimates for the twelve previous quarters. Time series data for earlier periods back to September quarter 1969 for the aggregates contained in the domestic production account (at both current and average 1979-80 prices), some selected income aggregates and implicit price deflators were published in Tables 32-42 of the December quarter 1984 issue of this publication. These supplementary tables will in future be published in the June and December quarter issues only.

Concepts, definitions, sources and methods

2. A basic guide to the Australian national accounts entitled *Australian National Accounts, Concepts, Sources and Methods* (5216.0) is available. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at current and constant prices and discusses the accuracy and reliability of the national accounts. The concepts, definitions, sources and methods applicable to the estimates contained in this publication are as described in 5216.0 but with the changes outlined in 'Changes in this issue' in the December quarter 1984 issue of this publication and in Appendix A, *Australian National Accounts, National Income and Expenditure, 1982-83* (5204.0).

Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter, and results in considerable variation in the estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be borne in mind when interpreting or using the estimates, for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in productivity.

5. Analysis of trends requires allowance for these uncertainties in estimation. The effects are in some

measure indicated by the change in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of the income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types—those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and are distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However the following example illustrates the *sensitivity* of quarter to quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$34 million then the measure of the rate of growth would be affected in three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of-course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Table 9 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix B of *Australian National Accounts, Concepts, Sources and Methods* (5216.0).

Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In Tables 6, 8, 9, 13, 17, 19, 22 and 23, *seasonally adjusted* values are presented

for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to bear in mind the methods by which they have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used in the ABS for making seasonal adjustments are described in *Seasonally Adjusted Indicators, Australia, 1983* (1308.0). However, special methods have been used to adjust some of the components of gross farm product which were not amenable to seasonal adjustment by the usual methods. To obtain the seasonally adjusted estimates, the estimated values of production of wheat, other grain and sugar cane, for any financial year, are distributed equally over the four quarters of the year ended June. One effect of these methods is that changes in the annual production of these commodities first enter into the seasonally adjusted figures in the September quarter.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for the corresponding current price estimates.

Analysis of contributions to growth table

12. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t)-A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage change tables shown elsewhere in this publication.

Rounding of figures

13. Although percentage changes are given to one decimal place in this publication, this does not imply that they can be regarded as accurate to the last digit shown. The figures after the decimal point are given to avoid distortions which may occur in rounding off the figures to the nearest half or whole number.

14. The procedures used in preparing this publication may occasionally result in rounding differences between figures in this publication and corresponding figures in other publications.

15. Where figures have been rounded, discrepancies may occur between sums of the component items and totals.

Related publications

16. In addition to those mentioned above other ABS publications which may be of interest include:

Historical Series of Estimates of National Income and Expenditure, Australia (5207.0) (\$1.10, \$1.90 incl. postage)—issued for December Quarter only.

Australian National Accounts, Gross Product by Industry, 1982-83 and 1983-84 (5211.0)

Budget Paper: *National Income and Expenditure, 1983-84* (5213.0)

17. Current publications produced by the ABS are listed in the *Catalogue of Publications, Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.
