STATE ACCOUNTS NOTES

FORTHCOMING ISSUES	ISSUE	RELEASE DATE
	5206.0 <i>Australian National Accounts: National Income, Expenditure and Product, March quarter 1995</i>	31 May 1995
	5242.0 <i>Australian National Accounts: State Accounts, March quarter 1995</i>	15 June 1995

REVISIONS IN THIS ISSUE	<p>Quarterly estimates for all aggregates have been revised in accordance with revised annual estimates which will be published later in <i>Australian National Accounts: State Accounts, 1993-94</i> (5220.0). Seasonally adjusted estimates have been revised following the annual reanalysis of seasonally adjusted series. Estimates of unincorporated enterprises gross operating surplus were benchmarked using data from taxation statistics for 1992-93. In addition, estimates for recent quarters have been revised due to the availability of more complete survey data.</p>	

CHANGES IN THIS ISSUE	<p>There are no changes in this issue. However, estimates of GSP at average 1989-90 prices were introduced for the first time in the September quarter 1994 issue of this publication. Details regarding the sources and methods used in their construction are provided in a Technical Note on pages 80-85.</p>	

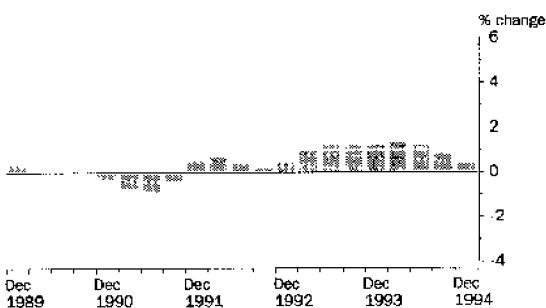

W. McLENNAN
AUSTRALIAN STATISTICIAN

MAIN FEATURES PERCENTAGE CHANGE IN GSP¹: Trend

¹Average 1989-90 Prices. See Note on page 10.

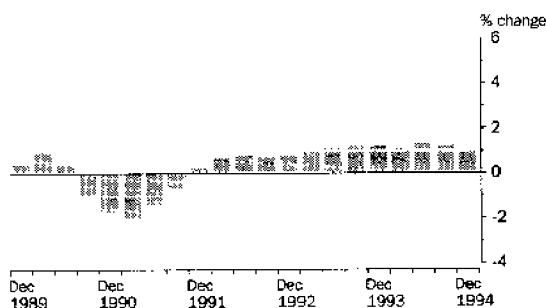

NEW SOUTH WALES

GSP grew by 0.4% in the December quarter 1994, very close to the national growth rate of 0.5%. The growth rate peaked in March quarter 1994 and has declined in each of the last three quarters. The GSP IPD increased by 2.3% between the December quarters of 1993 and 1994, contrasting with a final demand deflator movement of 0.2% over the same period, the latter movement reflecting the effects of declining import prices.

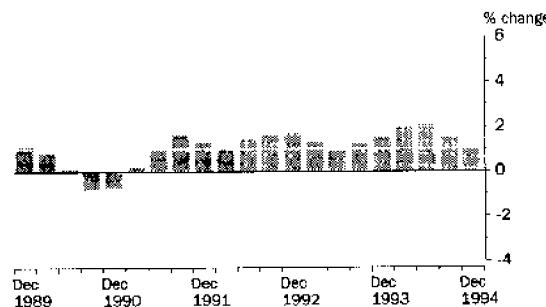

VICTORIA

Growth in GSP of 1.0% over the quarter was matched only by the growth in Queensland, with both experiencing growth at twice the national rate. December was the eighth consecutive quarter in which Victoria recorded growth of 1.0% or above. Victorian production has also kept pace with final demand over the four quarters to December quarter 1994 with growth rates of 4.6% and 4.7%, in GSP and SFD respectively.

QUEENSLAND

GSP grew by 1.0% in December quarter 1994 which, while lower than in previous quarters, is twice the national rate of 0.5%. GSP has reached a level 6.8% above that in December quarter 1993, and has more than matched the 6.3% increase in final demand over the period.

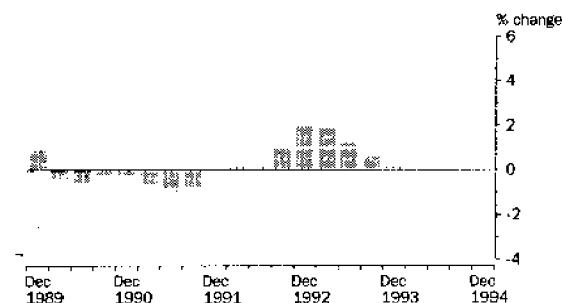

MAIN FEATURES PERCENTAGE CHANGE IN GSP¹: Trend *continued*

¹Average 1989-90 Prices. See Note on page 10.

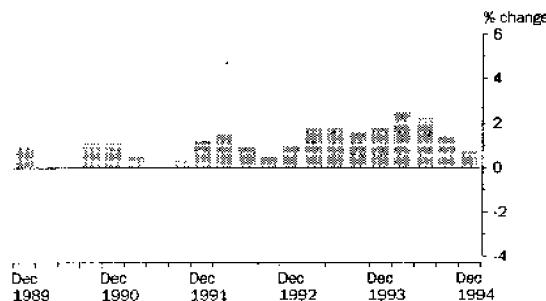

SOUTH AUSTRALIA

South Australia exports a significant proportion of its State production interstate and overseas. It is therefore possible for its demand deflator to be influenced by quite different factors from those influencing its production deflator. The growth in the SFD IPD of 1.1% over the year is above the national movement of 0.7%. The strong 5.0% growth in the GSP IPD over the year reflects the growth in prices of a number goods from the rural, mining and manufacturing sectors, which are exported from South Australia, including cereals, non-ferrous metals and motor vehicles. (see Note on p. 10)

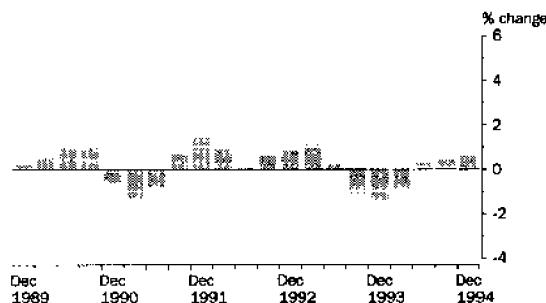

WESTERN AUSTRALIA

The strong growth of GSP over the last three years dipped to 0.7% in December quarter 1994, but still exceeds the 0.5% growth in demand over the quarter.

TASMANIA

The GSP IPD has increased by 4.6% over the year to December quarter 1994. This compares with a movement in the comparable national deflator of 1.8%. Tasmania exports a very significant proportion of its production interstate and overseas, and price movements of its exports had a significant impact on the aggregate production deflator without impacting on its final demand deflator. Growth in the SFD IPD of 2.0% was also well above the 0.7% increase in the national demand deflator. (see Note on p. 10)

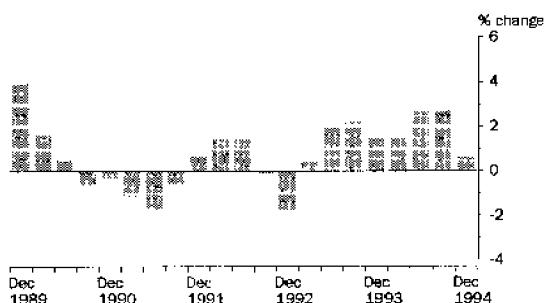

MAIN FEATURES PERCENTAGE CHANGE IN GSP¹: Trend *continued*

¹Average 1989-90 Prices. See note on page 10.

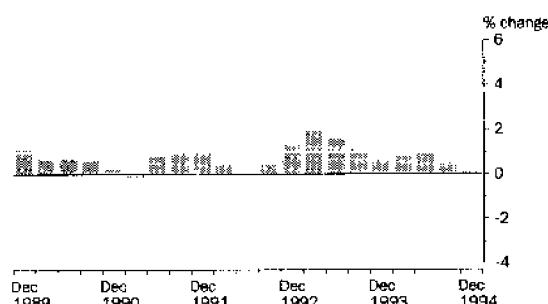

NORTHERN TERRITORY

GSP grew by 0.6% over the quarter to a level 7.7% higher than in December quarter 1993. This annual growth is the strongest experienced by any of the States and Territories and far outpaces growth in SFD of 3.9%. The GSP IPD rose slightly in December quarter 1994 by 0.1%, but is 1.3% lower than in December quarter 1993 reflecting falls in the prices of the internationally traded components of Northern Territory production, notably metalliferous ores and petroleum. The Northern Territory is the only State or Territory for which the movement in the production deflator is less than the movement in the final demand deflator on a quarterly or an annual basis. The SFD deflator rose by 0.4% in the December quarter 1994, but by only 0.7% from December quarter 1993.

AUSTRALIAN CAPITAL TERRITORY

The low 0.1% growth in the December quarter brings GSP to a level 2.5% above that of December quarter 1993. This modest growth exceeded growth in demand which has increased by only 0.3% over the latest four quarters, with demand declining in each of the last two quarters by 0.5%. The GSP IPD increased by 0.4% in December quarter 1994, contrasting with a decline of 0.4% in the final demand deflator. The contrast is more marked with respect to changes from December quarter 1993: the GSP IPD increased by 1.9% while the SFD IPD declined by 1.1%.

DECEMBER QUARTER SUMMARY COMMENT

NEW SOUTH WALES

- The 0.6% increase in SFD represents a decline in the rate of growth and continues the deceleration in the growth of SFD apparent in the September quarter 1994.
- Private gross fixed capital expenditure on equipment remained the major contributor to growth, growing by 4.4% in December quarter.
- In December quarter 1994 expenditure on equipment was at a level 41.8% above that of a year before.
- Private final consumption expenditure, which increased by 0.4%, was the other significant contributor to growth in final demand.

VICTORIA

- Growth in SFD over the December quarter 1994 was stronger than in all of the other States at 1.1%, and compares with a rate of 0.9% at the national level.
- Private sector expenditures accounted for all of the growth over the quarter, with private final consumption expenditure continuing to be the major contributor, as it has been throughout 1994.
- Private final consumption expenditure rose 1.2% over the December quarter 1994 to be 5.6% higher than in December quarter 1993.
- This growth occurred despite Victoria having the lowest population growth rate of all the States.

QUEENSLAND

- Final demand rose 0.7% in the December quarter to a level 6.3% above the December quarter 1993 level with a broad range of final expenditures contributing.
- Both private and public gross fixed capital expenditure have risen significantly over the four quarters to December quarter 1994, by 13.6% and 10.6% respectively.
- Private gross fixed capital expenditure on equipment is now 26.1% above the level of a year earlier.

MAIN FEATURES STATE FINAL DEMAND¹: Trend

¹Average 1989-90 Prices

SOUTH AUSTRALIA

- The December quarter 1994 growth of 0.7% in final demand is below the national movement of 0.9% and represents a slowdown from the growth experienced in the earlier part of the year.
- Private expenditures contributed all of the growth, with government consumption expenditure and public capital expenditure each down 1.6% from the previous quarter.
- Private gross fixed capital expenditure on equipment grew by 43.9% over the year.

WESTERN AUSTRALIA

- WA recorded relatively low growth of 0.5% in the December quarter. However, growth over the year is still similar to growth in national demand, 6.1% compared with 5.9%.
- Private final consumption expenditure was up 0.6% in the quarter and continued its strong contribution to growth over the year.
- Private gross fixed capital expenditure on equipment grew by 6.9% in the December quarter and by 46.9% over the year. By contrast, there was a 14.6% fall in expenditure on non-dwelling construction which continues the sharp downturn in that sector over the three quarters to December quarter 1994.

TASMANIA

- Final demand grew by 0.7% in the December quarter and by 2.3% over the year.
- Private gross fixed capital expenditure on equipment made the largest contribution to growth in the quarter, increasing by 6.8% to be 22.6% above the level of expenditure in December quarter 1993. Expenditure on non-dwelling construction increased by 2.8% to be 23.3% above the level of a year before.

NORTHERN TERRITORY

- Final demand grew by 0.8% in the December quarter 1994, just below the national growth rate of 0.9%. Growth over the year was 3.9%, well below the national growth rate of 5.9%.
- Private final consumption expenditure increased by 2.5% in the December quarter, to be 8.2% higher than in December quarter 1993.
- Private gross fixed capital expenditure on dwellings rose 5.6%, reflecting a sharp jump of 31.3% in seasonally adjusted terms, to be up 11.8% over the year, but this was more than offset by a strong fall in business investment.

AUSTRALIAN CAPITAL TERRITORY

- The ACT was the only State or Territory to experience a decline in final demand in the December quarter 1994, falling 0.5%. Growth over the year at only 0.3% was also far lower than elsewhere in Australia.
- Government final consumption expenditure declined 0.9% over the quarter, a movement comparable with the national fall of 0.7%, but such expenditure makes up a larger proportion of final demand in the ACT than in other States or Territories and therefore has a much more significant impact on growth.
- Private gross fixed capital expenditure was also very weak.

DECEMBER QUARTER SUMMARY COMMENT

NEW SOUTH WALES

- The rate of growth of GSP continued to slow, rising 1.0% in December quarter and 6.1% over the year to December quarter.
- Wages, salaries and supplements growth exceeded the corresponding growth rate for Australia in each of the last six quarters, with the December quarter rising 1.1%.
- GOS increased 0.7% for the second consecutive quarter, reflecting moderate growth in the mining indicator and in the farm sector.
- Growth in indirect taxes less subsidies was moderate in the December quarter, rising 1.7%, compared with stronger growth for the past six quarters.

VICTORIA

- GSP increased 1.2% in the December quarter to be 6.5% higher than a year earlier. Both these movements were similar to the corresponding national increases of 1.3% and 6.6% respectively.
- The increase in wages, salaries and supplements in the December quarter of 0.9% was below the corresponding increases in this aggregate in the first three quarters of 1994.
- GOS increased steadily (1.2%), reflecting growth in a number of activity indicators, particularly manufacturing.
- Indirect taxes less subsidies growth continued in the December quarter, rising 2.4%.

QUEENSLAND

- Following three quarters of stronger growth, GSP grew 1.6% in the December quarter, which was still above the corresponding national increase of 1.3%.
- Wages, salaries and supplements rose 1.2% in the December quarter and 8% over the year to December quarter, well above the corresponding national increase of 5.5%.
- Following three quarters of stronger growth, GOS growth moderated in the December quarter, rising 1.7% and 8.5% over the year to December quarter.
- Strong growth in indirect taxes less subsidies continued, rising 3.1%.

¹Current Prices

SOUTH AUSTRALIA

- GSP grew at a slightly slower rate in the December quarter, increasing 0.9% to be 4.9% higher than in December quarter 1993.
- Growth in wages, salaries and supplements weakened in the December quarter (rising only 0.1%) compared with the rates experienced from September quarter 1992.
- An increase of 2.1% in GOS for the December quarter, the highest of all the States, is mainly attributable to the retail and recreational services indicators.
- Following several quarters of stronger growth, indirect taxes less subsidies increased by only 0.4%.

WESTERN AUSTRALIA

- GSP grew steadily in the December quarter, rising 1.5% to be 8.0% higher than at the same time in 1993.
- Wages, salaries and supplements rose 1% to match the corresponding Australian rate, and grew 3.8% over the year to December quarter.
- The pace of growth in GOS slowed in the December quarter, rising 1.9%, compared with increases of 3.3% and 2.5% in the June and September quarters 1994.
- Strong growth in the last four quarters contributed to a 16.1% increase in indirect taxes less subsidies over the year to December quarter.

TASMANIA

- For the second consecutive quarter GSP grew at a steady rate of 1.4%, higher than the rates experienced during 1993-94.
- Wages, salaries and supplements grew 0.4% for the second consecutive quarter, slightly slower than at the growth rate experienced in the latter part of 1993-94.
- GOS increased 2.3% in the December quarter, the highest of all the States, and is now 6.4% higher than at the same time last year.
- Indirect taxes less subsidies increased 2.4% in the December quarter to be 11.6% higher than in December quarter 1993.

NORTHERN TERRITORY

- Following two quarters of strong growth, GSP rose 0.8%. Over the year to December quarter GSP grew 6.3%, slightly below the corresponding national increase.
- Wages, salaries and supplements maintained strong growth in the December quarter, rising 3.1%, the highest growth rate of all the States.
- Following three quarters of strong growth, GOS fell in the December quarter by 1.7%, but it is still 5.7% higher than in December quarter 1993.
- The growth rate of indirect taxes less subsidies fell in the December quarter rising 1.1% to be 13.9% higher than at the same time in 1993.

AUSTRALIAN CAPITAL TERRITORY

- GSP grew 0.6% in the December quarter, a slower rate of growth than that experienced in the previous nine quarters.
- The rate of growth in wages, salaries and supplements continued to decline, with an increase of only 0.1% in the December quarter.
- Growth in GOS in each of the last four quarters has been higher than the Australian average, with the December quarter rising 1.4%. Over the year to December quarter 1994 GOS grew by 10.3%.
- The slow growth rates experienced in indirect taxes less subsidies during 1994 contributed to a relatively low growth of 3.0% over the year to December quarter.

ANALYSES AND COMMENTS

GSP AT AVERAGE 1989-90 PRICES Care should be taken when interpreting the movements in constant price GSP. The methods used to derive the deflators for the balance between current price GSP(I) and State final demand attempt to directly estimate the price changes of the major items making up that balance, most particularly inter-State and international exports and imports. However, it is not possible to ensure that the corresponding effects on gross operating surplus are treated in an entirely consistent manner for quarters beyond those for which taxation data have been incorporated (that is, from September quarter 1993). The impact of any such inconsistency is likely to be most marked for those States for which the changes in the GSP deflator differ most from the Australian average. In recent quarters, the changes in the IPDs for GSP in South Australia and Tasmania are much higher than those for other States. Accordingly the growth rates in constant price GSP for those two States may be understated in recent quarters if this type of inconsistency between the income and expenditure sides is arising in practice.

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains estimates of gross domestic product and domestic final demand and their major components for each State and Territory from September quarter 1984 to the latest quarter. Trend data for the thirteen most recent quarters are shown in summary tables (Tables 4-12). Data for each aggregate in trend, seasonally adjusted and original terms are also shown in a set of long-term tables. The List of Tables, pages 11-12, indicates the range of data provided.

2 The term *gross State product* (GSP) is used to denote GDP(I) by State/Territory. Conceptually, GSP and GDP(I) are identical. Likewise, the term *State final demand* (SFD) is conceptually identical to domestic final demand at the national level (i.e. the sum of private and government final consumption expenditure and private and public gross fixed capital expenditure). Where *State* is referred to in the text, it is also meant to encompass the two Territories.

CONCEPTS, SOURCES AND METHODS

3 Information on concepts, definitions, data sources and methodology for the Australian national accounts in general is contained in the current edition of *Australian National Accounts: Concepts, Sources and Methods* (5216.0). Although annual estimates of State Accounts are covered in that publication, information relating to quarterly estimates by State is not currently included. However, conceptual issues relevant to annual State accounts also apply to the quarterly estimates.

4 National estimates are based on the concepts and conventions embodied in the United Nations, *A System of National Accounts* (SNA) 1968. No such standard is available for sub-national (regional/State) accounts. In the main, the national concepts are applicable to State accounts, but there remain a number of conceptual and measurement issues that either do not apply or are insignificant at the national level. These are discussed in detail in *State Accounts, Australia: Issues and Experimental Estimates*, ABS Occasional Paper 1984/4.

5 While it is possible in some cases to derive quarterly estimates by State using the same data sources as used for the Australian estimates (or to derive the Australian estimates as the sum of the States), it is often necessary to derive dissections of the Australian estimate using a variety of allocators. These allocators vary from being fairly closely related to the aggregate being measured to being only indirectly related. Information on some of the more important conceptual, methodological and data issues relating to quarterly estimates by State are provided below.

ACCURACY OF QUARTERLY ESTIMATES

6 The estimates contained in this publication represent allocations of quarterly estimates published for Australia in 5206.0. Therefore, they will reflect any inaccuracies in those estimates as well as inaccuracies introduced by the particular conceptual, methodological and data problems inherent in the allocation of Australian estimates to States and Territories. As such, the degree of accuracy and reliability will necessarily be lower than that for the counterpart Australian estimates. Some components by State are particularly deficient compared with the corresponding Australian estimates and are subject to potentially large revisions.

7 Estimates of GOS by State are especially deficient as a result of both conceptual issues in some industries and the lack of appropriate State data in some instances. The accuracy of the quarterly estimates is linked to the accuracy of the annual State estimates. For some industries, it is only possible to derive annual State estimates of GOS on the basis of fairly crude allocations of national estimates, or on conceptual bases that have particular limitations for some uses. As a result, the accuracy of annual State estimates is poorer, and sometimes significantly so, than that of the corresponding national estimates. By necessity, the quarterly State GOS estimates are substantially based on indirect indicators that do not necessarily have a direct relationship with GOS.

ACCURACY OF QUARTERLY
ESTIMATES (continued)

While these indicators are benchmarked to both the annual State estimates in 5220.0 and the quarterly Australian estimates in 5206.0, the accuracy of the quarterly estimates by State is considered to be significantly poorer than the corresponding 'benchmark' estimates. Therefore, they should be regarded as indicative only. Despite this qualification, it is considered that useful information is provided by these estimates as they draw together the various partial indicators of State economic activity within a consistent national accounting framework. It is expected that the quality of estimates will improve over time as new data sources and methodologies are developed.

8 Estimates for wages, salaries and supplements, private final consumption expenditure and private gross fixed capital expenditure are based on the results of sample surveys. By their nature, survey results become less accurate as they are disaggregated (for example into States and/or industries). Generally, the ABS surveys used to derive these aggregates are designed to provide accurate estimates at the Australian total level and individual State estimates that are less accurate but still of an acceptable quality. However, it should be noted that relative standard errors are generally higher for the smaller States and Territories than they are for the larger States. This may result in greater volatility in the quarterly estimates for the smaller States and the two Territories.

9 Estimates of indirect taxes less subsidies, government final consumption expenditure, and general government and public enterprise gross fixed capital expenditure can be substantially affected by the indicators chosen to apportion the Commonwealth government component to States and Territories. Care is required when interpreting these estimates.

REVISIONS

10 Most figures are subject to revision as more complete and accurate information becomes available. Revisions are of two types: those made to recent quarters and those made as a consequence of a redistribution across all quarters within a year following revisions to annual totals. In addition, the sources and methods used to compile these estimates will be further developed to improve the quality and scope of the estimates presented. Such developments may result in significant revisions to previously published estimates, particularly as experience is gained in assessing any biases which may be present in the estimates projected forward from the last annual benchmark available.

TREND ESTIMATES

11 Given the qualifications regarding the accuracy and reliability of the quarterly national accounts, the ABS considers that trend estimates provide the best guide to the underlying movements, and are more suitable than either the seasonally adjusted or original data for most business decisions and policy advice.

12 A trend estimate is obtained by removing the irregular component from the seasonally adjusted series. For estimates in this publication, it is calculated using a centred 7-term Henderson moving average of the seasonally adjusted series. Estimates for the three most recent quarters cannot be calculated using this centred average method; instead an asymmetric average is used. This can lead to revisions in the trend estimates for the last three quarters when data become available for later quarters, even if none of the original data for earlier quarters have changed.

13 If a series has a high 'irregular' component, then the trend estimates will be subject to greater revision than would otherwise be the case for the latest few quarters as data become available for subsequent quarters. However, it is important to note that this does not make the trend series inferior to the seasonally adjusted or original series. In fact, in such cases the effect of the irregular component on overall movements is likely to be even more marked in the seasonally adjusted and the original estimates than in the trend series.

TREND ESTIMATES (continued)

14 For more information about ABS procedures for deriving trend estimates and an analysis of the advantages of using them over alternative techniques for monitoring trends, refer to *A Guide to Interpreting Time Series — Monitoring 'Trends': an Overview* (1348.0) or contact the Assistant Director, Time Series Analysis on (06) 252 6345.

Two Feature Articles which have appeared in the ABS monthly publication *Australian Economic Indicators* (1350.0) may also be of interest:

- *Picking Turning Points in the Economy* (April 1991), and
- *Smarter Data Use* (March 1992).

15 Data that are affected by seasonal factors are adjusted to remove the effects of these factors. The general methods for doing so are described in Appendix I of *Australian National Accounts: Concepts, Sources and Methods* (5216.0). Three important points should be noted here :

- The methods used in seasonal adjustment do not force the sum of the adjusted estimates for each quarter of a year to equal the original annual total.
- Where constant price estimates have no apparent seasonality in their implicit price deflators, the estimates are adjusted using the corresponding factors for current price estimates.
- Special methods have been used to adjust some components of gross farm product. These concern the adjustment of crop production where production/harvest only occurs in one or two quarters each year. In these instances, the output for each financial year is distributed equally over the four quarters.

STATE AND TERRITORY VERSUS AUSTRALIAN SERIES

16 For trend and seasonally adjusted series, the sum of the States and Territories generally does not equal the corresponding estimate for 'total Australia', nor are the quarter-to-quarter movements identical. On a few occasions, these differences have been significant, particularly for the seasonally adjusted series. This reflects both the relatively short span of data available for seasonal analysis at the State level and the fact that seasonal analysis was generally carried out at a more aggregated level than for the 'total Australia' series. The State and Territory trend and seasonally adjusted series are less accurate than the Australian data. However, as the State and Territory time series lengthen, the quarterly movements in the sum of the State estimates should more closely match those in the Australian series.

17 For private final consumption expenditure an interim means of producing closer alignment between State seasonally adjusted series and the Australian total has been adopted. It involves using the quarterly movements in the total Australian series prior to September quarter 1984 to extrapolate back each of the individual State series before analysing the seasonal pattern of the series. This process has enabled account to be taken of the effects on trading patterns of the changing incidence of Easter on the assumption that there are no significant differences between States in this effect.

GROSS STATE PRODUCT

18 GSP is produced by summing factor incomes i.e. wages, salaries and supplements, and gross operating surplus (GOS), plus indirect taxes less subsidies. An expenditure based estimate of GSP is not available. Although domestic final demand and its components and international trade in goods are available by State, estimates of international trade in services, interstate trade in goods and services and increase in stocks by State are required to complete an expenditure-based estimate of GSP. These missing components, combined with the statistical discrepancy, are included as a balancing item in Tables 4 to 12.

WAGES, SALARIES AND
SUPPLEMENTS

19 Quarterly estimates of wages and salaries by State are obtained from the same data sources as those used for the Australian estimates (i.e. the ABS Labour Force Survey and the Survey of Employment and Earnings, both of which are designed to produce State data). However, it is generally the case that survey results for the smaller States and the Territories are subject to higher standard errors than those for the larger States. Estimates for supplements are essentially quarterly allocations and extrapolations of annual State totals, using wages and salaries by State as an indicator.

GROSS OPERATING SURPLUS

20 The ABS *Survey of Company Profits*, the major data source used to derive quarterly estimates of the gross operating surplus (GOS) of non-farm trading enterprise companies at the Australian level, does not provide estimates by State. Investigations into the availability of State data in company accounting records are currently underway with a view to collecting such data in the future. In the meantime, the approach adopted in these estimates is to derive synthetic estimates by State using indicators from the *Survey of Company Profits* and other general activity data available from the ABS and other sources.

21 Data from the quarterly *Survey of Company Profits* are used to derive quarterly State estimates of GOS for the mining industry from September quarter 1989. The relatively low number of respondents combined with the relatively high degree of coverage in the survey of mining enterprises made it feasible to allocate GOS to State individually for each respondent. In most cases, large multi-State enterprises already provide details of GOS for their separate mining divisions making direct allocation to State possible. Otherwise multi-State mining enterprise GOS was allocated to States using the number of employees in each State. (Quarters prior to September 1989 were estimated using mining activity data by State and mineral price data, both published by the Australian Bureau of Agricultural and Resource Economics.) Investigations are continuing into the possible use of data from the survey to derive State estimates of GOS for some other industries.

22 Quarterly estimates of ownership of dwellings GOS are derived from essentially the same sources used to produce the Australian estimates. Quarterly estimates of GOS by State for the remaining private sector non-farm enterprises and Commonwealth public trading enterprises together were derived by weighting together a variety of general activity indicators. It should be emphasised that some of these general activity indicators are not directly related to GOS, and therefore can only be regarded as indicative (see 'Accuracy of Quarterly Estimates' above).

23 State indicators include turnover for retail and selected service enterprises, building and construction work done, selected manufactured commodities produced combined with data on price movements, airline passenger movements through major airports, road freight movements between capital cities, tourist accommodation statistics and health insurance statistics. These indicators are weighted together (benchmarked) according to their contribution to annual industry estimates of GOS by State published in *Australian National Accounts: State Accounts* (5220.0).

24 The GOS of State and Local public trading enterprises is available directly from ABS collections. Quarterly estimates of GOS by State for the farm sector were prepared from essentially the same sources as those used to provide the Australian estimates, although a higher degree of approximation was required in the estimation of farm costs.

GROSS OPERATING SURPLUS
(continued)

25 Once a year (the December quarter issue), the composite quarterly indicator derived in the manner described above is balanced to both the quarterly estimates of GOS for Australia published in 5206.0 and the annual estimates for individual States published in 5220.0. It involves alternately balancing the rows and columns. A similar process is followed for the columns (the control totals are derived from the annual State data contained in 5220.0). The rows and columns continue to be balanced alternately until the matrix is completely balanced. In issues subsequent to the December quarter, the fully balanced estimates for each State are extrapolated on the basis of the indicators and balanced to the quarterly estimates for Australia published in 5206.0.

INDIRECT TAXES LESS
SUBSIDIES

26 Indirect taxes received and subsidies paid by State and Local governments are available quarterly from government financial records. Indirect taxes received and subsidies paid by the Commonwealth government are allocated to State using production data where available, but mainly by applying annual State proportions to the quarterly totals.

PRIVATE FINAL CONSUMPTION
AND GROSS FIXED CAPITAL
EXPENDITURES

27 State estimates of private final consumption expenditure and gross fixed capital expenditure are derived largely from the same sources as used for the Australian estimates, although a higher degree of approximation is required. In the case of private final consumption expenditure, data sources for major components such as household goods, dwelling rent, purchase of motor vehicles, fares, and purchases of gas, electricity and fuel are available quarterly by State.

28 State and Territory estimates of private gross fixed capital expenditure on dwellings and non-dwelling construction are derived using data from the ABS quarterly surveys of Building Activity and Engineering Construction, while expenditure on equipment is derived from the quarterly Survey of Private New Fixed Capital Expenditure. Real estate transfer expenses are derived from data supplied by the various State Stamp Duty Offices, and various other data such as the number of real estate property transfers by State and Territory. Essentially, these are the same data sources used to prepare the Australian estimates.

COMMONWEALTH
GOVERNMENT FINAL
CONSUMPTION AND GROSS
FIXED CAPITAL EXPENDITURES

29 The treatment of Commonwealth government final expenditures in regional accounting is rather problematic. Alternative treatments are to attribute final expenditures to the region in which the expenditure was incurred, or to the region in which the beneficiaries reside, or even to consider the Commonwealth government consumer unit as extra-territorial and therefore to exclude it from all regions. For practical reasons the first approach has been adopted in this publication, although it still required extensive use of indirect indicators. An implication is that a large proportion of the consumption of Commonwealth Government services is included in SFD for the ACT, inflating the balancing item for that territory. If data had been available to allocate Commonwealth final consumption expenditure to end users, the balancing item for the ACT would be a much smaller negative because the provision of the services would be regarded as an interstate export instead. Estimates for Commonwealth government expenditures in the States on both an annual and a quarterly basis therefore have to be treated with considerable caution.

30 The wages and salaries component of Commonwealth government final consumption expenditure was directly apportioned to States using data from the ABS Survey of Employment and Earnings and information supplied by the Department of Defence. Expenditures on goods and services classified to defence were allocated according to population while non-defence purchases were allocated on the basis of Commonwealth general government employment by State and Territory.

COMMONWEALTH
GOVERNMENT FINAL
CONSUMPTION AND GROSS
FIXED CAPITAL EXPENDITURES
(continued)

31 For Commonwealth general government gross fixed capital expenditure, Australian estimates were first subdivided into expenditure on construction and expenditure on equipment. The construction expenditure component was allocated to States and Territories using annual State dissections for projected construction expenditure in each State and Territory, published jointly by the Department of Administrative Services and the Department of Industry, Technology and Commerce. Expenditure on equipment has been allocated using Commonwealth general government employment by State and Territory.

COMMONWEALTH
ENTERPRISES GROSS FIXED
CAPITAL EXPENDITURE

32 A variety of allocators has been applied at the individual enterprise level for Commonwealth public enterprise gross fixed capital expenditure. Direct allocators have been used in a few cases where enterprises operated wholly in one State or Territory. For Telecom, State data for construction activity were available by quarter from the ABS Building Activity and Engineering Construction Surveys. Indirect indicators derived from annual estimates were used to allocate gross fixed capital expenditure of the remaining Commonwealth enterprises by State. For example, purchases of ships and aircraft were allocated using annual State shares for general freight and passenger activity through ports and airports in each State and Territory (consistent with the allocation of GOS).

OCCASIONAL PAPER

33 The following Occasional Paper, which discusses issues specific to State Accounts, is available at ABS offices:

- *State Accounts, Australia: Issues and Experimental Estimates* — S. Burrell, J. Daniel, A. Johnson and R. Walters (1984/4)

RELATED PUBLICATIONS

34 In addition to the publications already mentioned, others of interest include:

TECHNICAL NOTE—GSP AT CONSTANT PRICES

INTRODUCTION

1 Constant price estimates of gross State product (GSP) were introduced in the September quarter 1994 issue of this publication. They represent the latest stage in the process of addressing the continuing demand for State specific activity indicators. (State will be used to refer to the eight States and Territories throughout this document.) They continue the process of extending the available State indicators which has involved the gradual development from the initial annual current price estimates of GSP(I) to include a quarterly dimension, to cover constant price estimates of State final demand (SFD) and to incorporate seasonally adjusted and trend, as well as original, estimates.

2 The constant price estimates of GSP correspond to the current price, income-based estimates of GSP, (GSP(I)). An explanation of why this approach has been adopted and details of the methods used are discussed below. In addition, the limitations of the method and of the resultant estimates are discussed.

3 While the ABS has attempted to make the best use of the available data with the limited resources available, users are warned that the quality of the estimates is not as high as the corresponding national estimates. This reflects a number of factors, including: higher relative sampling errors; the 'fuzziness' of some State data arising from reporting businesses and government agencies operating across the country and the resulting difficulty of allocating their activities by State; and the limited availability of source data on a State basis in a number of areas.

MEASURES OF GDP AND GSP

4 Gross domestic product (GDP) and its State equivalent gross State product (GSP) are the most prominent national accounts statistics. They measure the total market value of goods and services produced in the region under consideration over a period after deducting the cost of goods and services used up in the process of production (intermediate consumption), but before deducting consumption of fixed capital. By definition, the value of production in a period must equal the income earned from that production and the final expenditure on the goods and services produced (an allowance is made for changes in stocks). This means that GDP (and GSP) can be derived using three different approaches:

GDP(P): The value of all final goods and services produced in the domestic (State) economy over the period;

GDP(I): The sum of all incomes accruing to the factors of production over the period, including net indirect taxes; and

GDP(E): The sum of all final expenditures on domestic (State) production, including the increase in stocks.

CONSTANT PRICE ESTIMATION

OF GSP

5 Each constituent of GSP(P) and GSP(E) can be conceived uniquely as the product of a price and a quantity. For example, twenty tonnes of wheat at \$150 per tonne, or two kilograms of tomatoes at \$1 per kilogram, or five seats at a cinema at \$11 per seat, or rent paid for 100 square metres of retail floor space at \$50 per square metre per month. However, the constituents of GSP(I) cannot be conceived uniquely as the product of a price and a quantity. While one might argue that the wages paid to an individual are equal to the product of the number of hours worked and the hourly wage rate, many employees are not paid according to the number of hours worked and the supplements paid are generally independent of the number of hours worked. Moreover, from the employees' perspective the value of wages and salaries is more to do with their purchasing power than any hourly wage rate. As gross operating surplus is the residual

**CONSTANT PRICE ESTIMATION
OF GSP (continued)** flow of income to the owners of capital after the payment of labour costs and net indirect taxes, there is no way of conceiving of it as the product of a price and a quantity. However, while it is not possible to construct constant price estimates of GSP(I) by deriving constant price estimates of its components and summing them, it is possible to deflate the current price estimate of GSP(I) if a suitable aggregate deflator can be formed. This is the way the constant price estimates of GDP(I) are derived: the current price estimate of GDP(I) is deflated by the implicit price deflator of GDP(E) (derived by dividing the current price estimates of GDP(E) by the constant price estimates of GDP(F)). Hence, in theory at least, the methods used to derive the constant price estimates of GDP(E), GDP(P) and GDP(I) could be used to derive the corresponding State estimates.

6 Let us consider these three options. At present, current and constant price estimates of State final demand (SFD) (the sum of private and public expenditures on consumption and gross fixed capital) are compiled and published, but there are no estimates of GSP(E). The reason is the lack of State stocks data and, most importantly, the lack of State data relating to international trade in services and interstate trade in goods and services. The difficulty and cost of compiling State trade data of reasonable quality are considered to be very substantial. A more tractable solution may be to compile constant price estimates of GSP(P), but here again there are problems with a lack of source data, and the resources required to both rectify that deficiency and to compile the estimates would be substantial. Consequently, the approach taken has been to develop State-specific deflators to deflate the current price estimates of GSP(I). The method of compilation of these deflators is discussed below.

METHOD USED

**BRIDGING THE GAP BETWEEN
SFD AND GSP** **7** As discussed above, it is not possible to derive an expenditure-based estimate of gross State product (GSP(E)) in either current or constant price terms because of the absence or incompleteness of State data in respect of the component items between SFD, which measures the expenditures on final goods and services by the residents of the State, and GSP, which measures the production of final goods and services within the State. The difference between these two measures reflects the total of the following data items:

increase in stocks;
plus international exports of goods;
plus international exports of services;
less international imports of goods;
less international imports of services;
plus interstate exports of goods;
plus interstate exports of services;
less interstate imports of goods;
less interstate imports of services.

8 In order to develop the best GSP deflators possible, an approach has been adopted which essentially involves deriving the best possible current and constant price estimates of significant subsets of the above data items. For each State, current price estimates of the identified components are added to the current price estimates of SFD and, similarly, the constant price estimates of those components are added to the constant price estimates of SFD. The quotient derived by dividing the aggregate constant price estimates into the aggregate current price estimates is a Paasche (current-weighted) price index. This price index is used to revalue the current price estimates of GSP(I). It is crucial to identify separately those components for which the deflators deviate significantly from the average, since the method adopted effectively attributes the weighted average deflator to the unidentified components. Available information on the State distribution of these

BRIDGING THE GAP BETWEEN SFD AND GSP (continued) data items has been drawn on where possible and alternative indicators, as detailed below, have been used in their absence. Nevertheless, the aggregate current and constant price estimates used in the derivation of this deflator are not considered to be complete measures. They merely serve to produce the best deflators for GSP(I) that the available data and resources allow.

9 In some instances, both the current and constant price estimates of a component, or some approximation to them, are split by State using available indicators. In other instances, either a current or a constant price split is derived and the corresponding constant or current price estimates are derived by deflation if the initial split is in terms of current price estimates, or inflation if the initial split is in terms of constant price estimates. There is limited price information available at the State level, especially in the area of producers' prices and prices of internationally traded goods and services, which are the prices most relevant to the data items comprising the difference between GSP and SFD. There is an assumption underlying the approach adopted in deriving the aggregate State deflators that price competition will imply that the available price indicators are reasonably indicative of changes in prices at the State level. This is a less distorting assumption if the price indicators are weighted together at a reasonable level of commodity disaggregation, and implies deriving current and constant price estimates at as fine a level as possible. The indicators used in the generation of State component splits are necessarily partial and this leads to caution about the accuracy of the derived GSP deflators. A description of the available data sources in respect of each of the component categories and the way in which they have been used follows.

INCREASE IN STOCKS **10** There is no available State dimension to the existing quarterly stocks survey estimates. Available information on stock holding, production or sales has been used to produce a State allocation of the national totals, in current and constant prices, for a number of sectors for which price variation in the component commodities is considered likely to have a significant impact on the individual aggregate State deflators or for which indicator data were readily available.

Private non-farm stocks:

Mining: Annual estimates of stock levels, by State, are available from mining census data for each of the two categories non-metallic minerals and metallic minerals (see *Mining Industry, Australia* (8402.0)). These have been used to split stocks estimates from the quarterly survey of stocks onto a State basis.

Manufacturing: Annual factor cost estimates of manufacturing production, by State, based on manufacturing census data (see *Manufacturing Industry, Australia* (8221.0)) have been used to produce State splits of the national estimates of the increase in stocks.

Retail trade: Quarterly estimates of retail turnover, by State, based on estimates from the monthly retail turnover survey, have been used to allocate, by State, estimates of the increase in stocks.

Wholesale trade: A fixed relationship between States has been derived from wholesale turnover estimates from the 1991–92 survey of wholesalers (see *Wholesale Industry: Details of Operations* (8638.0)). This fixed relationship has been used to allocate, by State, increases in wholesalers' stocks.

Farm and public marketing authority stocks:

Wool Corporation stocks and wool held on farm: International exports of wool, by State, have been used as State indicators of stockholdings (and hence increase in stocks) for this component.

Sugar and wheat: Allocated to States on the basis of production data.

- *****
- INTERNATIONAL EXPORTS OF GOODS** **11** Detailed current price estimates of exports of goods on a recorded trade basis at the two-digit level of the Standard International Trade Classification (SITC) have been revalued using national deflators to produce constant price estimates of this component. These data are on the basis of State of origin, that is, the State in which the final stage of manufacture or production occurs. For most exports this should correspond to the required basis for State allocation, that is, the State of final resident ownership. There is an assumption that the national deflators will provide a reasonable measure of change in price at the State level. Revaluation at the two-digit level of the Standard International Trade Classification (SITC) is a compromise giving a reasonable level of disaggregation by commodity type without increasing the volume of the revaluation exercise too significantly. There are a very limited number of cases where more specific deflators have been used to replace the national deflator at the SITC division level. This is true in cases where the composition of a particular division is known to be very variable between States and the division includes commodities with price movements which deviate significantly from the division average. Mineral and agricultural commodities are likely to be significant in this regard.
- INTERNATIONAL EXPORTS OF SERVICES** **12** A variety of activity indicators has been used to derive State contributions to the national current and constant price estimates of exports of services. Since there are no available indicators of variations in the component deflators between States, the same splits have been applied in current and constant price terms. The indicators used are as follows:
- Freight and insurance on exports:* Split by State on the basis of volume of recorded trade estimates of exports, by State.
- Port services:* Split by State on the basis of volume of recorded trade (imports plus exports), by State.
- Passenger and travel services and expenditure by foreign government and resident entity employees:* These items are components of the final expenditure category which is subtracted from private final consumption expenditure (PFCE) in order to adjust it from a territorial to a resident basis. In order to ensure consistency of treatment the same State indicators are used in splitting these export components as are used in splitting the relevant equivalent components of the PFCE category *net expenditure overseas* onto a State basis.
- Financial, insurance, miscellaneous and official services:* Split on the basis of SFD.
- INTERNATIONAL IMPORTS OF GOODS** **13** A similar approach has been adopted to that employed in the derivation of current and constant price estimates for the corresponding exports item (see above). The level of revaluation corresponds broadly to the commodity sub-group level of the balance of payments merchandise imports end-use classification of imports, that is, two-digit Broad Economic Classification (BEC) by three-digit level of the SITC. These data are on the basis of the State in which the imports were released from Australian Customs Service control. In most cases this will correspond to the State of initial resident ownership which is the required basis of State allocation. No information is available on which to base an adjustment for goods which are released from custom's control in a State other than that in which their owner resides.
- INTERNATIONAL IMPORTS OF SERVICES** **14** The same approach has been adopted for the international import of services as for the corresponding export item (see above).
- INTERSTATE TRADE IN GOODS** **15** This category of expenditure is made up of:
- Interstate exports of goods; and
 - Interstate imports of goods.
- These data items are different from those above in that the flows must net to zero at the national level and hence there are no equivalent current price estimates at the national
- *****

INTERSTATE TRADE IN GOODS
(continued) level which can be split and no relevant price indicators derived in relation to these items at the national level. The strategy adopted:

- generates constant price estimates;
- derives deflators relevant to these flows; and
- inflates the constant price estimates to yield current price estimates.

16 The strategy for deriving constant price estimates in relation to these items is as follows. For those States for which survey data by commodity on the value of interstate imports and exports of goods are available (Western Australia (annual) and Queensland (quarterly)), the data have been deflated. We therefore have both current and constant price estimates. For the remaining States, as a check on the Western Australian and Queensland results, and to extrapolate and interpolate the latter, indicators of interstate imports and exports have been used. These have been derived using broad (constant price) activity indicators to extrapolate interstate trade flow estimates which have been derived using estimates from the database of the MONASH-MR model of the Australian economy developed by the Monash University Centre of Policy Studies as described in *Notes on the Construction of the 1986-87 Input-Output Database for the MONASH-MR Model* by G.A. Meagher. The model yields estimates of interstate trade in goods by industry and State of supply and by State of destination. The relationships between the estimates by State and by industry are assumed to be fixed over time. The estimates in this issue are based on the Monash model's original input-output database which relates to the year 1986-87. The Monash input-output database has recently been updated to 1990-91 and will be available for incorporation in future issues. The 1986-87 Monash database identifies interstate trade flows only with respect to three industries: agriculture, mining and manufacturing. In addition an internationally sourced component of interstate exports and imports has been incorporated by the ABS. This component has not been derived directly from the Monash data, but by comparison of the Monash net interstate trade estimates and the net interstate trade balances after identifying all other items, by State in 1986-87.

17 For each State an interstate import deflator and an interstate export deflator have been derived. These deflators are:

- fixed weighted for agriculture and current weighted for mining and manufacturing up to the industry level on the basis of production or turnover estimates; and
- fixed weighted between industries for exports and fixed weighted between industries and between supplying States for imports on the basis of the composition of interstate trade in 1986-87 as identified in the Monash model.

State by industry deflators have been derived by the following means:

Agriculture, etc: Australian Bureau of Agricultural and Rural Economics (ABARE) indexes of prices received by farmers, by State have been used for this industry, (see the ABARE quarterly publication *Indexes of prices received and paid by farmers*). These price indexes are Laspeyres (fixed weighted) and while it would have been possible to produce Paasche indexes using component commodity prices and production details by commodity, given the relative importance of the flows in this sector and the possibly low correlation between the composition of production and the composition of the interstate trade component, this additional degree of complexity has not been pursued.

Mining: State Paasche price indexes have been compiled by weighting together price indicators for a variety of mineral commodities using monthly mineral production data. Both the price and quantity estimates are consistent with those published in the quarterly ABARE publication, *Quarterly Mineral Statistics*.

INTERSTATE TRADE IN GOODS *Manufacturing:* State annual Paasche price indexes have been derived using turnover data from the annual manufacturing census for weights and producer price indexes. These annual price indexes have been extrapolated and interpolated using quarterly Paasche price indexes derived using production indicators from the monthly ABS surveys of manufacturing production and ABARE production data to weight relevant component producer price indexes.

(continued)

18 The deflators for the internationally sourced component of interstate trade reflect the fact that only estimates of the net flows have been made for this component. A Paasche price index of international imports into New South Wales and Victoria, the net exporter States, is used for revaluation of flows into the net importer States and the respective aggregate State international import deflators have been used for flows out of New South Wales and Victoria.

19 Current price estimates of interstate import and export flows have been derived by inflating the extrapolated constant price estimates using the deflators derived as described above.

**INTERSTATE TRADE IN
SERVICES**

20 This category of expenditure includes the following components:

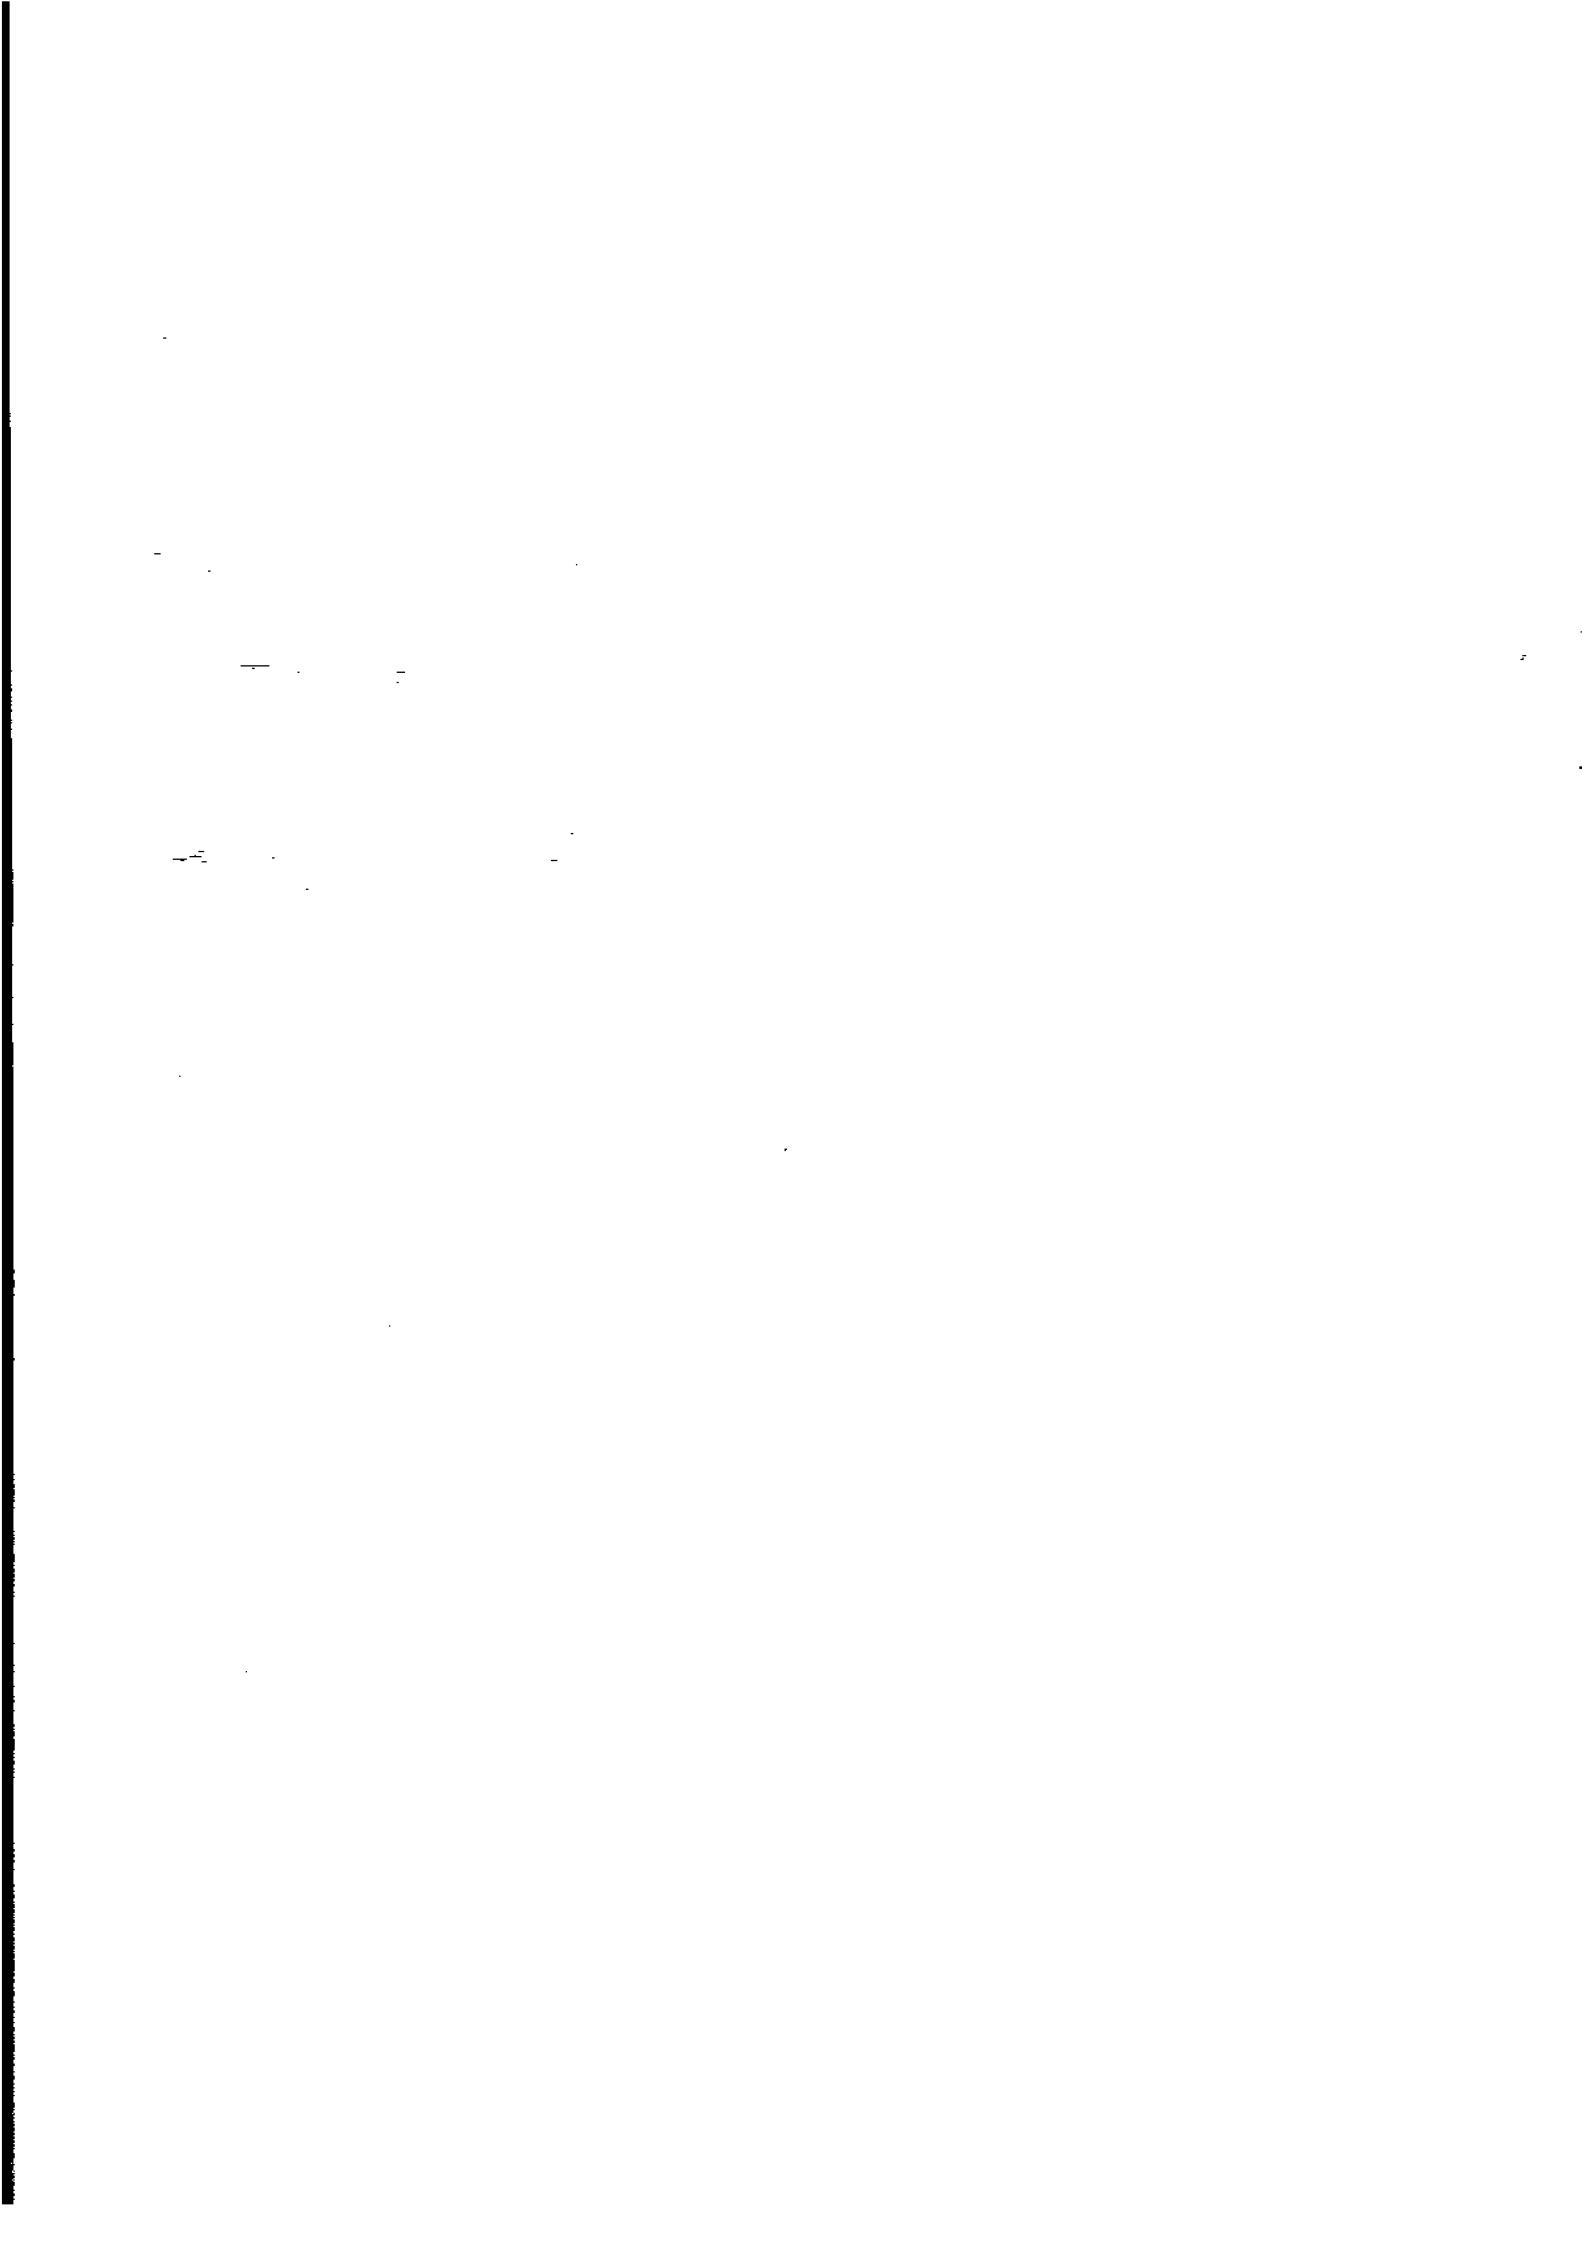

- Interstate exports of services; and
- Interstate imports of services

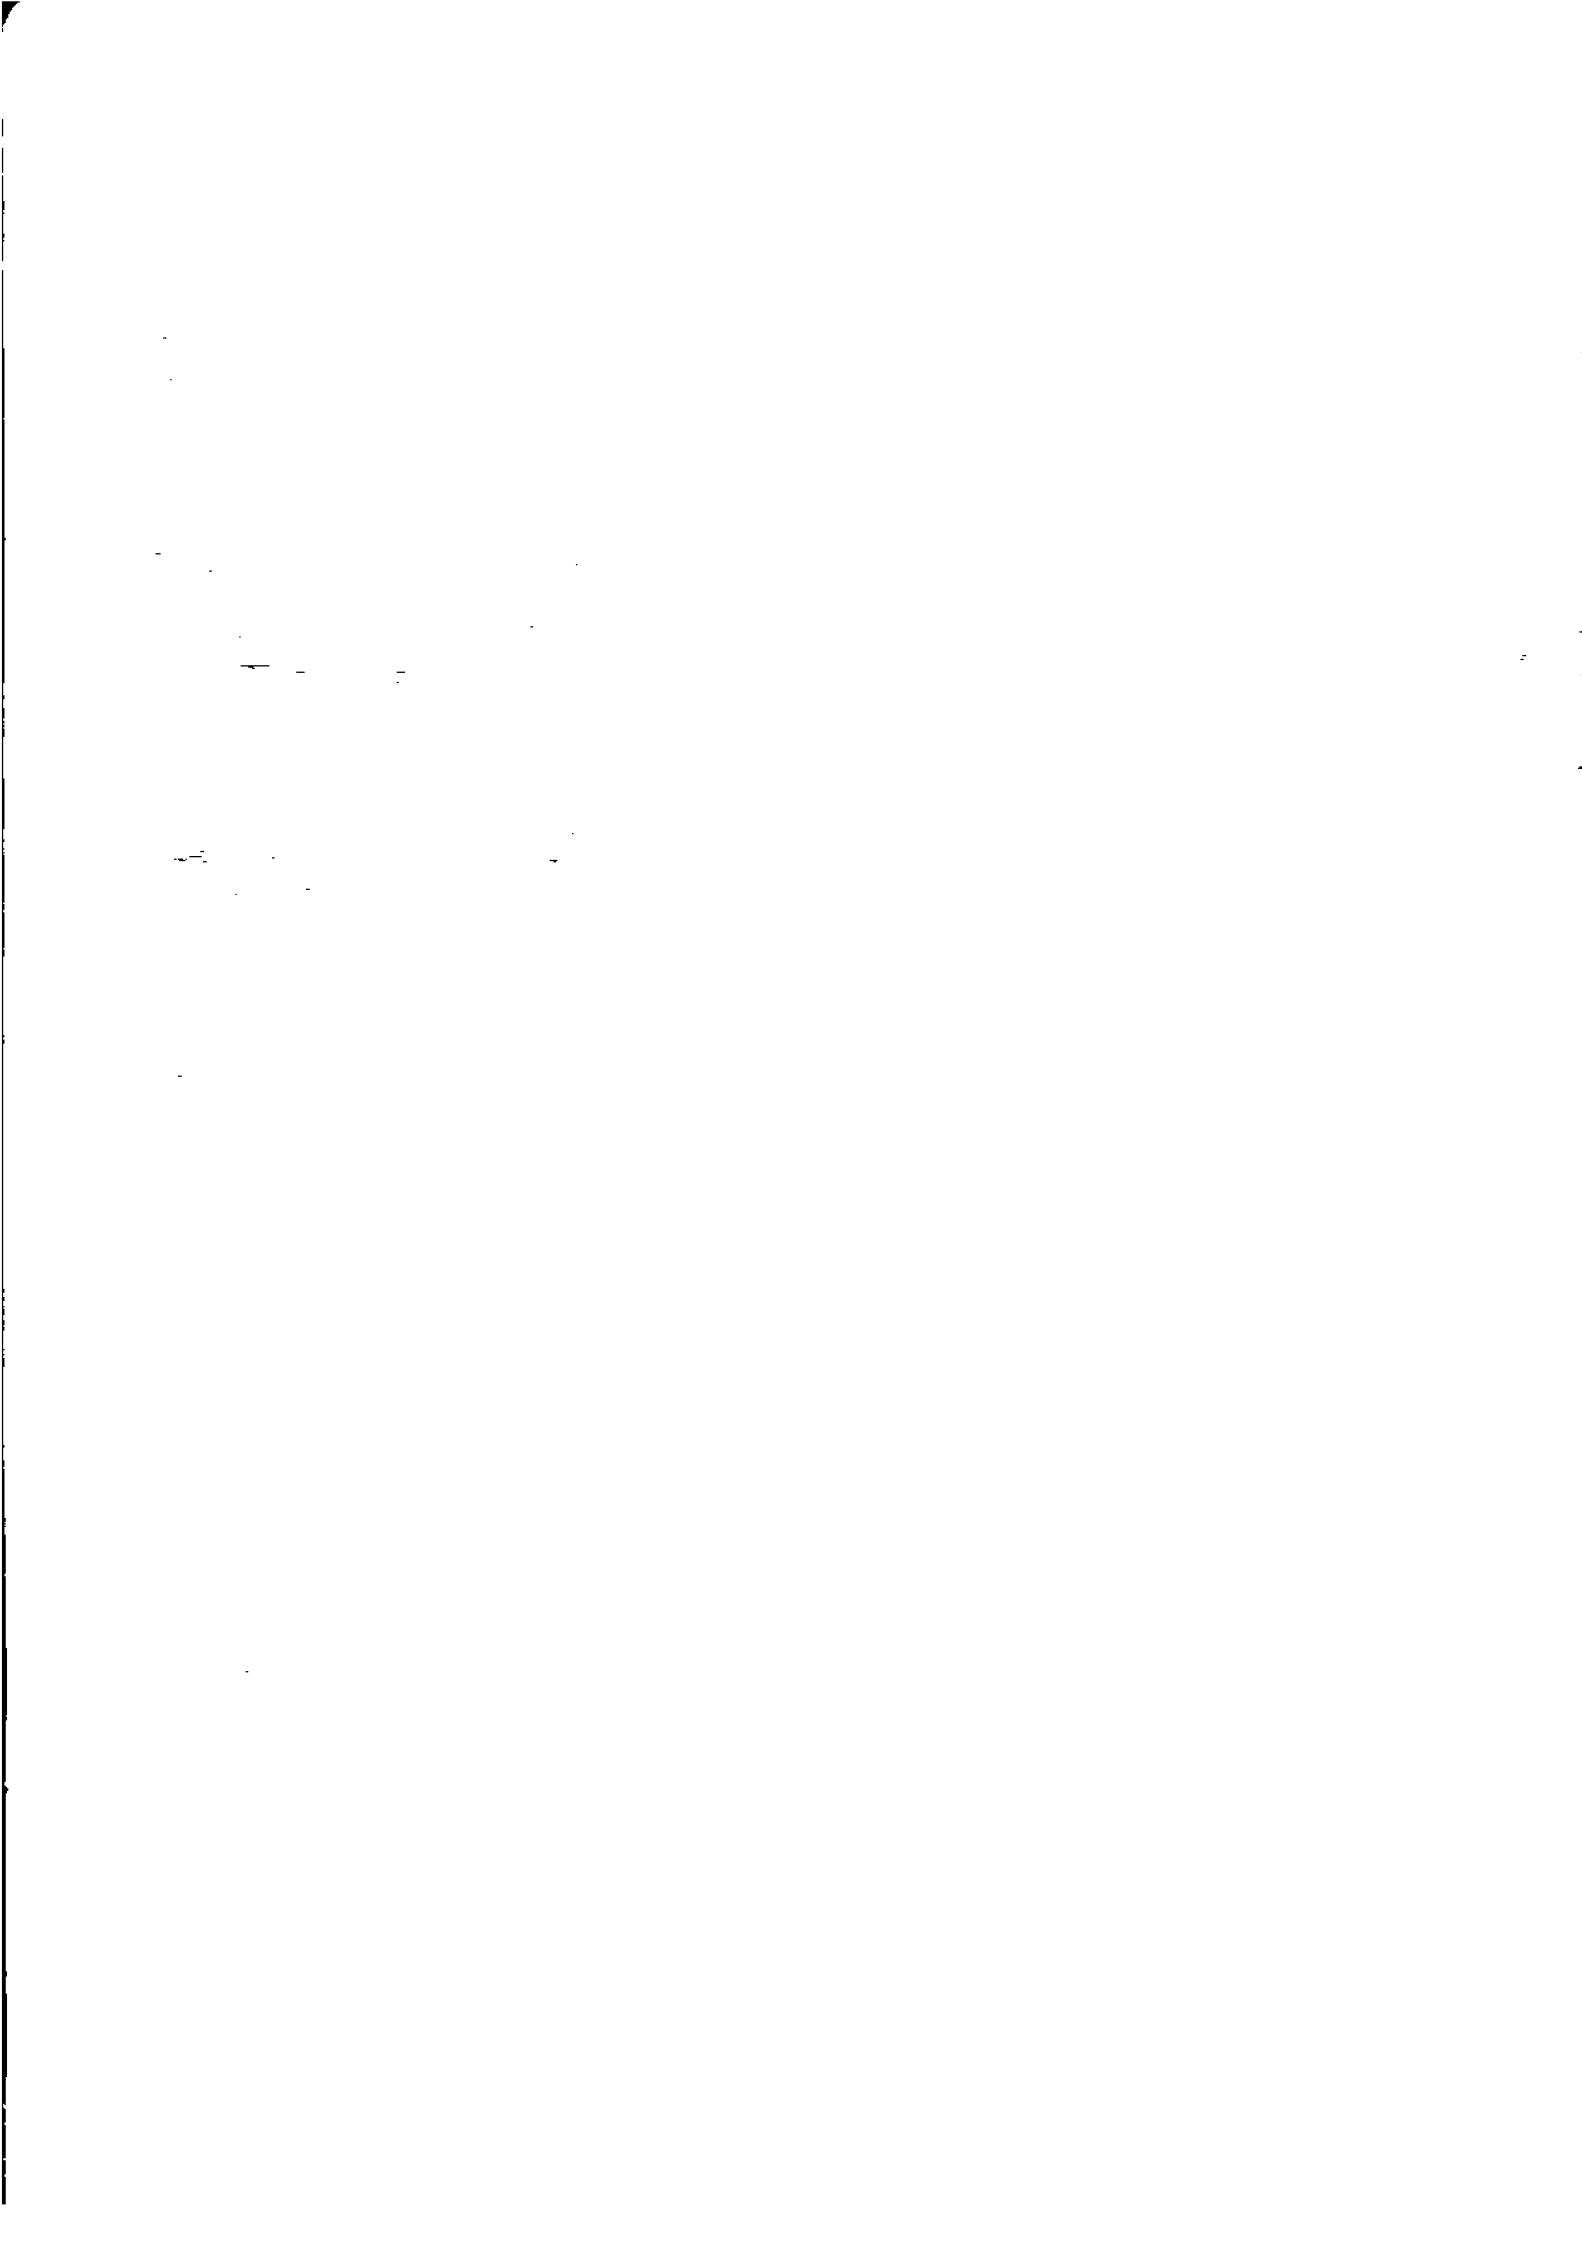

Trade in services, which is not accounted for in the model used for goods, is likely to be significant in the case of at least some of the States, with the ACT likely to be particularly affected. State estimates of private final consumption expenditure include an adjustment to account for net expenditures interstate on services by households. This item has been added to private final consumption expenditure in order to adjust it from a territorial to a resident basis. In order to ensure consistency of treatment, the current and constant price estimates of household expenditures interstate have been included here, but with the opposite sign. Unfortunately, it has not been possible to include estimates for the net expenditures interstate on services by the business and government sectors. The net effect of making only partial allowance for the interstate flow of services is that the balance of this item will be attributed the weighted average deflator derived for the identified components of GSP, including SFD.

**SEASONAL ADJUSTMENT AND TREND
ESTIMATES**

21 The constant price estimates of GSP(I) have been seasonally adjusted at the aggregate level since there are no component constant price estimates available for analysis. The seasonal adjustment factors comprise a combination of the current price seasonal adjustment factors, seasonal adjustment factors for the implicit price deflator and an adjustment for the varying number of pay days in a quarter that contributes to the variation in the current price estimates of GSP(I).

22 The trend estimates have been derived by applying a seven-term Henderson moving average to the seasonally adjusted estimates.
