#### QUARTER KEY POINTS

### ACTUAL EXPENDITURE

- The trend estimate (in constant price terms) of new capital expenditure has continued the consistent rise observed since the June quarter 1993. The June quarter 1994 rise of 3.9% is comparable with the growth rate over the last three quarters (see Table 3).
- The preliminary estimates for 1994-95 (in original terms) show that, compared with 1993-94, capital expenditure on buildings rose by 9.8% and equipment expenditure rose by 24.4%. Total capital expenditure rose by 20.3%.

### EXPECTED EXPENDITURE

- The latest estimate for 1995-96 is \$35,111m, a rise of 11.2% over the second estimate for the year from the March quarter 1995 survey revised results.
- If the realisation ratios from 1994-95 were to be applied to this estimate, the outcome for total expenditure in 1995-96 would be a rise of 10.6%, with expenditure on buildings rising by 7.3% and expenditure on plant and equipment rising by 11.6%.

# QUARTERLY TREND ESTIMATES AT CONSTANT PRICES

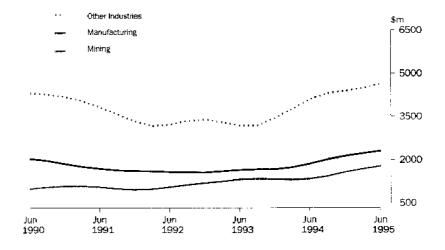

BY ASSET

The graph below shows the trend series for New Capital Expenditure by type of asset at average 1989-90 prices.

BY INDUSTRY

The graph below shows the trend series for New Capital Expenditure by broad industry group at average 1989-90 prices.

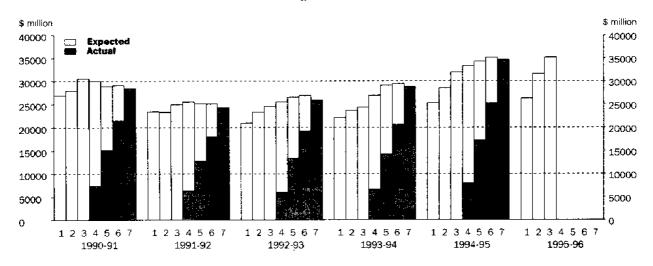

### ACTUAL AND EXPECTED NEW CAPITAL EXPENDITURE

## FINANCIAL YEARS AT CURRENT PRICES

#### **EXPENDITURE**

The seven estimates of actual and expected expenditure for each financial year which appear in the graph below relate to the data contained in Table 4. Care should be exercised when using these series and the associated realisation ratios.

INTRODUCTION

**1** This publication contains estimates of actual and expected new capital expenditure by private businesses in Australia. The series contained in this publication have been compiled from data collected in a quarterly survey of private businesses.

SCOPE OF THE SURVEY

- **2** This survey aims to measure the value of new capital expenditure by private businesses in Australia. Private households and public sector businesses (ie all departments, authorities and other organisations owned or controlled by Commonwealth, State or Local Government) are outside the scope of the survey.
- **3** The scope of the survey:
- includes the following Australian and New Zealand Standard Industrial Classification (ANZSIC) industries

Manufacturing (21-29)

food, beverages and tobacco (21)

textiles, clothing, footwear and leather (22)

wood and paper products (23)

printing, publishing and recorded media (24)

petroleum, coal, chemical and associated products (25)

non-metallic mineral products (26)

metal products (27)

machinery and equipment (28)

other manufacturing (29)

Mining (11-15)

Other Selected Industries

Construction (41,42)

Wholesale (45-47)

Retail (51-53)

Transport & storage (61-67)

Finance (73-75)

Property & Business Services (77-78)

Other non-manufacturing (including electricity & gas communication; accommodation, cafes & restaurants; cultural & recreational services; and other services (36,37,57,71,91-93,95,96)

excludes the following industries

Agriculture, Forestry and Fishing

Government Administration & Defence

Education

Health and Community Services

SURVEY METHODOLOGY

**4** This quarterly survey is based on a stratified random sample of private business units recorded on the ABS central register of economic units. The sample consists of approximately 8000 units. The figures obtained from the selected businesses are supplemented by data from units which have large capital expenditure and/or large employment and which are outside the sample framework, or not adequately covered by it.

TIMING AND CONSTRUCTION OF SURVEY CYCLE

**5** Surveys are conducted in respect of each quarter and returns are completed in the 8 or 9 week period after the end of the quarter to which the survey data relate (e.g. March quarter survey returns are completed during April and May). Full details of the reporting cycle are shown in the table below.

Period to which reported data relates							
	1993-94	1994-95	1995-96				
Survey quarter	Dec Mar Jun	Sep Dec Mar Jun	Sep Dec Mar Jun				
December 1993	Act E1	E2					
March 1994	Act Act E1	E2					
June 1994	Act Act Act	E1 E2					
September 1994		Act E1 E2					
December 1994		Act Act E1	E2				
March 1995		Act Act E1	E2				
June 1995		Act Act Act Act	E1 E2				

- **6** Businesses are requested to provide 3 basic figures each survey:
- Actual expenditure incurred during the reference period (Act)
- A short term expectation (E1)
- A longer term expectation (E2)
- **7** This survey cycle facilitates the formation of estimates of expenditure for financial years (12 months ending 30 June). For instance, as the above table shows, the first estimate for 1994-95 was available from the December 1993 survey as a longer term expectation (E2). It was subsequently revised in the March 1994 survey (again as a longer term expectation) and in the June 1994 survey as the sum of two expectations (E1 + E2). In the September and subsequent surveys the estimate is updated, being derived as the sum of actual expenditure (for that part of the year completed) and expected expenditure for the remainder of the year. Finally, the seventh estimate from the June quarter 1994 survey, will be derived by summing the actual expenditure for each of the four quarters.

SAMPLE REVISION

- **8** Each year the survey frame and the sample are revised prior to the June quarter survey to ensure that they remain representative of the survey population. In the course of this revision some of the business units from the sample strata are rotated out of the sample and replaced by others to spread the reporting workload equitably. As a check on comparability, information is collected from both the old and revised samples for the June quarter. In this publication, estimates derived from a June quarter survey are based on the newer of the two samples.
- **9** Estimates of level derived from the new sample may differ from estimates derived from the old sample. These differences are due to several factors including changes in the composition of the population and sample, reclassification of some statistical units, different industries and inadequate provisions in the old sample estimate for new businesses commencing during the year. Where differences have been found to be significant, adjustments have been made to data for prior quarters to minimise the impact on movements between March and June quarter survey estimates.

SAMPLE REVISION continued

- **10** To minimise the size of these adjustments the ABS produced an estimate of the contribution expected from new businesses each quarter, taking into account the number of businesses in the survey sample which ceased trading during the quarter.
- **11** In the 12 month period between successive frames and survey samples there are many businesses which cease operating and many which are newly established. Such changes in the business population need to be reflected in the survey to ensure that the estimates produced are representative of the changing nature of the business population over the course of the year.
- **12** Improvements have been introduced to the methodology for updating the annual survey frame population using direct counts each quarter of new businesses added, or in the process of being added, to the ABS business register. Estimates of new capital expenditure for the growth in the business population are made each quarter.

STATISTICAL UNIT

13 This survey uses the Management Unit as the statistical unit. The management unit is the highest level accounting unit within a business, having regard to industry homogeneity, for which accounts are maintained. In nearly all cases it coincides with the legal entity owning the business (i.e. company, partnership, trust, sole operator, etc.). In the case of large diversified businesses, however, there may be more than one management unit, each coinciding with a 'division' or 'line of business'. A division or line of business is recognised where separate and comprehensive accounts are compiled for it. Prior to 1989, the survey was on a different business unit basis. Further details are available on request.

CLASSIFICATION BY INDUSTRY

- **1.4** The Australian and New Zealand Standard Industrial Classification (ANZSIC) has been developed for use in both countries for the production and analysis of industry statistics. It replaces the Australian Standard Industrial Classification (ASIC) and the New Zealand Standard Industrial Classification (NZSIC) which have been in use for many years. Both have been widely accepted as statistical standards in their own right.
- **15** There has been extensive consultation with external users to ensure that the ANZSIC reflects the structure of Australian and New Zealand industry and user requirements for statistics. The Australian Bureau of Statistics and the New Zealand Department of Statistics encourage other organisations to use the classification in their own work in order to improve the comparability and usefulness of the statistics.
- **16** In the development of the ANZSIC greater emphasis has been placed on alignment with the international standards than has been the case in the past. The International Standards Industrial Classification of All Economic Activities (ISIC), Revision 3, has been used as the international standard for reference purposes. This will lead to significant improvements in the comparability of industry statistics internationally.

- 17 Because of the introduction of ANZSIC and its use in this publication, changes occur in classification categories when compared to previous releases of this publication. As an example, categories listed in Table 1 and under "Manufacturing" differ from previously. The old (ASIC) classification: "Textiles, Clothing & Footwear" becomes (in part) the new ANZSIC classification: "Textiles, Clothing, Footwear & Leather". The correspondence between these categories is not strictly one-to-one. Accordingly, care should be taken when making comparisons between years where different classifications have been used.
- **18** Users are referred to a detailed analysis of ANZSIC/ASIC and ASIC/ANZSIC concordances contained in the joint ABS, New Zealand publication: *Australian & New Zealand Standard Industrial Classification*, *1993, ANZSIC*, ABS Cat. No. 1292.0 and New Zealand Cat. No. 19.005.0092.
- **19** In order to classify new capital expenditure by industry, each statistical unit (as defined above) is classified to the Australian and New Zealand Standard Industrial Classification (ANZSIC) industry in which it *mainly* operates.
- **20** The total value of all new capital assets acquired by each statistical unit **either** on own account or under a finance lease is classified to the ANZSIC industry in which it mainly operates even though it may have activities in other industries.

ESTIMATES AT 1989-90 PRICES

**21** Estimates at 1989-90 prices are presented, in Table 3. The deflators used to revalue the current price estimates are the same as the price deflators compiled for the national accounts aggregates 'Private gross fixed capital expenditure on non-dwelling construction' and 'Private gross fixed capital expenditure on equipment'.

DERIVATION AND USEFULNESS OF REALISATION RATIOS

- **22** Once actual expenditure for a financial year is known, it is useful to investigate the relationship between each of the prior 6 estimates and that actual. The resultant realisation ratios (subsequent actual expenditure divided by expected expenditure) then indicate how much expenditure was actually incurred against the amount expected to be incurred at the various times of reporting. Realisation ratios can also be formed separately for 3 or 6 month expectations as well as the 12 month E2 estimates or combinations of estimates containing at least some expectation components (e.g. 6 months actual and 6 months expected expenditure).
- **23** Realisation ratios provide an important tool in understanding and interpreting expectation statistics for future periods. The application of realisation ratios enables the adjustment of expectation data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectation data and actual expenditure estimates. For example, if one wished to predict actual expenditure for 1993-94 based on the June 1993 survey results and compare this with 1992-93 expenditure, it is necessary to apply relevant realisation factors to the expectation to put both estimates on the same basis. Once this has been done the predictions can be validly compared with each other and with previously derived estimates of actual expenditure for earlier years.
- **24** There are many ways in which realisation ratios can be applied to make predictions of actual expenditure for a future period. For instance, the adjusted estimates shown on page 1 of this publication were derived using realisation ratios which are the average of the latest available five observations. A range of realisation ratios for both type of asset and industry estimates is provided in Tables 4 and 5.

DERIVATION AND USEFULNESS OF REALISATION RATIOS continued

**25** In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised in the application of realisation ratios. This is particularly the case with the twelve month expectations collected in the December and March surveys.

DESCRIPTION OF TERMS

- **26** New capital expenditure refers to the acquisition of new tangible assets either on own account or under a *finance lease* and includes major improvements, alterations and additions. In general, this is expenditure charged to fixed tangible assets accounts excluding expenditure on second hand assets unless these are imported for the first time.
- 27 Some estimates are dissected by type of asset:
- New Buildings and Structures. Includes industrial and commercial buildings, houses, flats, home units, water and sewerage installations, lifts, heating, ventilating and similar equipment forming an integral part of buildings and structures, land development and construction site development, roads, bridges, wharves, harbours, railway lines, pipelines, power and telephone lines. Also includes mine development (e.g. construction of shafts in underground mines, preparation of mining and quarrying sites for open cut extraction and other developmental operations primarily for commencing or extending production). Excludes purchases of land, previously occupied buildings and speculatively built projects intended for sale before occupation.
  - Equipment, plant and machinery. Includes plant, machinery, vehicles, electrical apparatus, office equipment, furniture, fixtures and fittings not forming an integral part of buildings, durable containers, special tooling, etc. Also includes good imported for the first time whether previously used outside Australia or not

RELIABILITY OF THE ESTIMATES

- **28** Since the estimates are based on data obtained from a sample rather than a complete enumeration, the data and the movements derived from them are subject to sampling variability; that is, they may differ from the figures—that would have been obtained if all units had been included. One measure of the likely difference is given by the standard error, which indicators the extent to which an estimate might have varied by chance because only a sample of units was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors.
- **29** Another measure of sampling variability is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling. The sample estimates of quarter to quarter movement in the value of new capital expenditure are also subject to sampling variability. The relative standard error of the estimate of movement is expressed as a percentage of the quarterly estimate of the level of capital expenditure. The relative standard errors for estimates of movement between March and June quarters are subject to somewhat higher standard errors than those shown on Page 2 due to the annual revisions made to the sample of businesses selected.

RELIABILITY OF THE ESTIMATES continued

- **30** The imprecision due to sampling, which is measured by the standard error, is not the only type of inaccuracy to which the estimates are subject. Other inaccuracies, referred to collectively as non-sample error, may occur for a number of reasons. The major ones of concern and which may affect the data are:
- misreporting of data by respondents;
- deficiencies in the central register of economic units particularly in respect of small units.
- **31** Every effort is made to reduce the non-sample error to a minimum by careful design of questionnaires, efficient editing and operating procedures and appropriate methodology.

SEASONAL ADJUSTMENT

- **32** The quarterly actual new capital expenditure series in this publication are affected to some extent by seasonal influences and it is useful to recognise and take account of this element of variation.
- **33** Seasonal adjustment may be carried out by various methods and the results may vary slightly depending on the procedure adopted. Accordingly, seasonally adjusted statistics are in fact only indicative and should not be regarded as in any way definitive. In interpreting seasonally adjusted data it is important therefore to bear in mind the methods by which they have been derived and the limitations to which the methods used are subject. Particular care should be taken in interpreting quarter to quarter movements in the adjusted series in the publication.
- **34** At least once each year the seasonally adjusted series are revised to take account of the latest available data. The most recent reanalysis takes into account data collected up to and including the June quarter 1994 survey. Data for periods after June 1994 are seasonally adjusted on the basis of extrapolation of historical patterns. The nature of the seasonal adjustment process is such that the magnitude of some revisions resulting from reanalysis may be quite significant, especially for data for more recent quarters. For this reason, additional care should be exercised when interpreting movements in seasonally adjusted data for recent quarters.
- **35** It should be noted that the seasonally adjusted figures necessarily reflect the sampling and other errors to which the original figures are subject.
- **36** Details of the seasonal adjustment methods used together with selected measures of variability for these series are available on request.

TREND ESTIMATES

**37** The trend estimates are derived by applying a 7-term Henderson moving average to the seasonally adjusted series. The 7-term Henderson average (like all Henderson averages) is symmetric, but as the end of a time series is approached, asymmetric forms of the average are applied. Unlike the weights of the standard 7-term Henderson moving average, the weights employed here have been tailored to suit the particular characteristics of individual series. While the asymmetric weights enable trend estimates for recent quarters to be produced, it does result in revisions to the estimates for the most recent three quarters as additional observations become available. There may also be revisions because of changes in the original data and as a result of the re-estimation of the seasonal factors. For further information, see *A Guide to Interpreting Time Series* — *Monitoring 'Trends': an Overview* (1348.0) or contact the Assistant Director, Time Series Analysis on (06) 252 6345.

# COMPARABILITY WITH NATIONAL

**ACCOUNTS ESTIMATES** 

- **38** The statistics for new capital expenditure shown in his publication differ from estimates of private gross fixed capital expenditure shown in the Australian National Accounts for the following reasons:
- **39** National Accounts estimates incorporate data from other sources as well as information from the capital expenditure survey. For example, estimates for capital expenditure on 'equipment' are based on annual statistics of depreciable assets available from the Taxation Commissioner. Quarterly estimates are interpolated between and extrapolated from the annual taxation based estimates using a variety of indicators including this survey. The ABS's quarterly Building Activity Survey and Engineering Construction Survey are the main sources for estimating the National Accounts dwelling and non-dwelling construction items respectively.
- **40** National Accounts estimates include capital expenditure by all private businesses including units classified to agriculture, forestry, fishing and hunting and community services industries and capital expenditure on dwellings by households. Data for these sectors are excluded from this publication.
- **41** National Accounts estimates include the value of work done on speculative construction projects as the work is put into place. The statistics in this publication, however, include full value of the speculative projects as new capital expenditure of the purchases (if in scope), when the project is sold.
- **42** For equipment, the National Accounts estimates relate to acquisitions less disposals of all fixed tangible assets whereas the survey figures are acquisitions of new fixed tangible assets only.
- **43** For a more detailed explanation of the concepts and methods used in compiling the National Accounts estimates see *Australian National Accounts: Concepts, Sources and Methods* (5216.0)

# WHAT IF...? REVISIONS TO TREND ESTIMATES

# EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

Each time new seasonally adjusted estimates become available, trend estimates are revised (see paragraphs 29 and 34 of Explanatory Notes).

#### TREND REVISIONS

The examples in the tables below show two illustrative scenarios and the consequent revisions to previous trend estimates of capital expenditure by private businesses and.

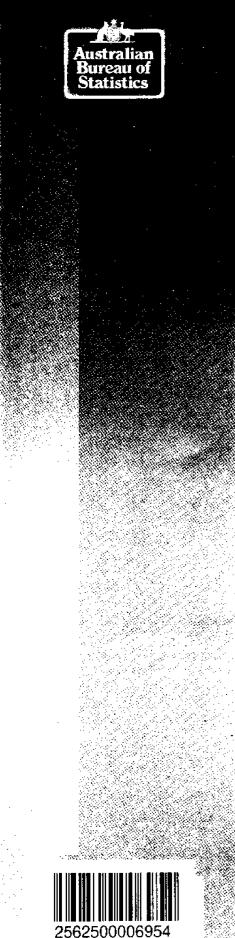

- **1** The September seasonally adjusted estimate is higher than the June estimate by the percentage shown.
- **2** The September seasonally adjusted estimate is lower than the June estimate by the percentage shown.

The percentages chosen are approximately the long term average movement, without regard to sign, in the seasonally adjusted series.
