

**PRIVATE NEW CAPITAL EXPENDITURE, AUSTRALIA
ACTUAL AND EXPECTED EXPENDITURE TO JUNE 1995
MARCH QUARTER 1994 SURVEY**

NOTE: This release is the final issue of Catalogue No. 5626.0. Commencing with the September quarter 1994, data which would have been published in 5626.0 will be published in an expanded version of 5625.0, which is based on preliminary survey results. The first release of this expanded publication will also include the first release of data classified in accordance with the Australian and New Zealand Standard Industrial Classification (ANZSIC).

MAIN FEATURES

Compared with preliminary March quarter survey results published in Cat No 5625.0 on 25 May, these latest estimates show small upward revisions for the March quarter 1994 and short term expected capital expenditure for the 3 months to June 1994. A more significant upward revision has been made to longer term expectations for 1994-95.

Actual Expenditure - March Quarter 1994

In seasonally adjusted 1989-90 price terms, expenditure decreased by 3% in the March quarter 1994. Expenditure on Buildings and structures decreased by 1% and expenditure on Equipment, plant and machinery decreased by 5%.

Expected New Capital Expenditure 1993-94

The latest estimate of expected new capital expenditure for 1993-94 is \$27,684m. This represents a marginal increase over the December quarter survey expectation for 1993-94.

March quarter survey estimates of expected current year expenditure tend to be under-realised. The table below shows likely approximate percentage changes for 1993-94 over 1992-93 if the degree of under-realisation that occurred last year were to be repeated this year.

	% Change Expected Expenditure 1993-94 over Actual Expenditure 1992-93 (current prices)

SEASONALLY ADJUSTED SERIES
AT AVERAGE 1989-90 PRICES

Expected New Capital Expenditure 1994-95

The second estimate of expected new capital expenditure for 1994-95 is \$26,426m which is 12% above the corresponding expectation for 1993-94 from the March quarter 1993 survey. This latest estimate represents an increase of 13% over the first estimate collected in the December quarter 1993 survey.

Historically, actual expenditure for a financial year has usually proved to be significantly above the second estimate of expected expenditure for the year. The degree of over-realisation has recently been about 10% and if repeated in 1994-95 will mean that actual expenditure for the year will be about 9% above likely 1993-94 expenditure.

INQUIRIES

• for further information about statistics in this publication and the availability of related unpublished statistics, contact Bruce Jamieson on Canberra (06) 252 5611 or any ABS State Office.

• for information about other ABS statistics and services please refer to the back page of this publication.

EXPLANATORY NOTES

Introduction

This publication contains estimates of actual and expected new capital expenditure by private businesses in Australia. The series contained in this publication have been compiled from data collected in a quarterly survey of private businesses.

2. These estimates replace and expand on the preliminary estimates previously published in *Private New Capital Expenditure Australia, Preliminary* (5625.0) released on 25 May 1994.

Scope of the survey

3. This survey aims to measure the value of new capital expenditure by private businesses in Australia. Private households and public sector businesses (ie all departments, authorities and other organisations owned or controlled by Commonwealth, State or Local Government) are outside the scope of the survey.

4. Because of various collection and compilation difficulties, the statistics in this publication exclude estimates relating to agriculture and community services industries. The construction industry data, whilst collected previously, has only been published since June quarter 1990. From the June quarter 1989, unincorporated non-employing units were excluded from the scope of the ABS central register of economic units. From that date, new businesses in this category were not added to the register. Units in this category which were already on the register have been deleted in various stages.

Methodology

5. This quarterly survey is based on a stratified random sample of private business units recorded on the ABS central register of economic units. The sample consists of approximately 8000 units. The figures obtained from the selected businesses are supplemented by data from units which have large capital expenditure and/or large employment and which are outside the sample framework, or not adequately covered by it.

Statistical unit

6. From the beginning of 1989, the ABS has introduced a new statistical unit known as the management unit. This unit is defined as:

the highest-level accounting unit within a business, having regard to industry homogeneity, for which accounts are maintained; in nearly all cases it coincides with the legal entity owning the business (ie company, partnership, trust, sole operator, etc). In the case of large diversified businesses, however, there may be more than one management unit, each coinciding with a 'division' or 'line of business'. A division or line of business is recognised where separate and comprehensive accounts are compiled for it.

7. The management unit is being implemented on the ABS central register of economic units and included in this survey as reporting arrangements are finalised. Where the management unit has not yet been implemented the statistical unit is still the operating legal entity as presently recorded on the ABS central register of economic units.

Classification by industry

8. In order to classify new capital expenditure by industry, each statistical unit (as defined above) is classified to the Australian Standard Industrial Classification (ASIC) industry in which it *mainly* operates.

9. The total value of all new capital assets acquired by each statistical unit either on own account or under a finance lease is classified to the ASIC industry in which it mainly operates even though it may have activities in other industries.

10. The industries shown in this publication are detailed below. The numbers in brackets relate to the ASIC subdivisions as defined in the 1983 edition of ASIC.

MINING (11-16)**MANUFACTURING (21-34)**

- Food, Beverages and Tobacco (21)
- Textiles, Clothing and Footwear (23,24)
- Paper and Printing, including paper, paper products, printing and publishing (26)
- Chemicals, Petroleum and Coal Products, including chemicals, fertilizers, paints, explosives, cosmetics, oil refining and coal products (27)
- Basic Metal Products (29)
- Transport Equipment (32)
- Fabricated Metal Products, including other industrial machinery and equipment and household appliances (31-33)
- Other Manufacturing, including wood, wood products and furniture (except sheet metal), glass, clay and other non metallic mineral products, and other manufacturing n.e.c. (25,28,34)

FINANCE, PROPERTY AND BUSINESS SERVICES (61-63)**OTHER SELECTED INDUSTRIES (36-59, 91-93)**

- Electricity, Gas and Water including sewerage and drainage (36-37)
- Construction, including house and other residential and non-residential building, non building construction and special trade construction (41-42)
- Wholesale Trade (47)
- Retail Trade (48)
- Transport and Storage, including road, rail and air transport, shipping, stevedoring and storage (51-58)
- Other Non-Manufacturing, including communication, entertainment, recreation, restaurants, hotels and personal services (59, 91-93)

TOTAL INDUSTRIES, excluding public sector and all industries classified to Agriculture, Forestry, Fishing and Hunting, and Community Services.

Estimates at 1989-90 prices

11. Estimates at 1989-90 prices are presented, by type of asset, in seasonally adjusted terms in Table 3. The deflators used to revalue the current price estimates are the same as the price deflators compiled for the national accounts aggregates 'Private gross fixed capital expenditure on non-dwelling construction' and 'Private gross fixed capital expenditure on equipment'.

Sample revision

12. Each year the survey frame and the sample are revised prior to the June quarter survey to ensure that they remain representative of the survey population. In the course of this revision some of the business units from the sample strata are rotated out of the sample and replaced by others to spread the reporting workload equitably. As a check on comparability, information is collected from both the old and revised samples for the June quarter. In this publication, estimates derived from a June quarter survey are based on the newer of the two samples.

13. Estimates of level derived from the new sample may differ from estimates derived from the old sample. These differences are due to several factors including changes in the composition of the population and sample, reclassification of some statistical units to different industries and inadequate provisions in the old sample estimate for new businesses commencing during the year. Where differences have been found to be significant, adjustments have been made to data for prior quarters to minimise the impact on movements between March and June quarter survey estimates.

Timing and construction of survey cycle

14. Surveys are conducted in respect of each quarter and returns are completed in the 8 or 9 week period after the end

of the quarter to which the survey data relate (e.g. March quarter survey returns are completed during April and May). Full details of the reporting cycle are shown in the table below.

15. Businesses are requested to provide 3 basic figures each survey:

- (a) Actual expenditure incurred during the reference period (Act)
- (b) A short term expectation (E1)
- (c) A longer term expectation (E2)

16. The design of the survey cycle readily facilitates formation of estimates of expenditure for financial years (12 months ending 30 June). For instance, as the table below shows, the first estimate for 1993-94 was available from the December 1992 survey as a longer term expectation (E2). It was subsequently revised in the March 1993 survey (again as a longer term expectation) and in the June 1993 survey as the sum of two expectations (E1 + E2). In the September and subsequent surveys the estimate is updated, being derived as the sum of actual expenditure (for that part of the year completed) and expected expenditure for the remainder of the year. Finally, the seventh estimate from the June quarter 1994 survey, will be derived by summing the actual expenditure for each of the four quarters.

Derivation and usefulness of realisation ratios

17. Once actual expenditure for a financial year is known, it is useful to investigate the relationship between each of the prior 6 estimates and that actual. The resultant realisation ratios (subsequent actual expenditure divided by expected expenditure) then indicate how much expenditure was actually incurred against the amount expected to be incurred at the various times of reporting. Realisation ratios

SURVEY OF PRIVATE NEW CAPITAL EXPENDITURE - REPORTING CYCLE

Survey Quarter	Financial Year Estimate Obtained(a)		Period to which reported data relate(b)											
	1993-94	1994-95	1992-93			1993-94				1994-95				
			Dec	Mar	June	Sept	Dec	Mar	June	Sept	Dec	Mar	June	
Dec 92	1	—	ACT	E1		E2								
Mar 93	2	—	ACT	ACT	E1	E2								
June 93	3	—	ACT	ACT	ACT	E1	E2							
Sept 93	4	—				ACT	E1	E2						
Dec 93	5	1				ACT	ACT	E1		E2				
Mar 94	6	2				ACT	ACT	ACT	E1	E2				
June 94	7	3				ACT	ACT	ACT	ACT	E1	E2			

(a) These numbers align with the numbers associated with financial year estimates shown in Graph 1 and Tables 4 and 5.

(b) ACT represents actual expenditure for that quarter. E1 and E2 represent estimates of short term and longer term expected expenditure respectively.

can also be formed separately for 3 or 6 month expectations as well as the 12 month E2 estimates or combinations of estimates containing at least some expectation components (e.g. 6 months actual and 6 months expected expenditure).

18. Realisation ratios provide an important tool in understanding and interpreting expectations statistics for future periods. The application of realisation ratios enables the adjustment of expectations data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectations data and actual expenditure estimates. For example, if one wished to predict actual expenditure for 1993-94 based on the June 1993 survey results and compare this with 1992-93 expenditure, it is necessary to apply relevant realisation factors to the expectation to put both estimates on the same basis. Once this has been done the predictions can be validly compared with each other and with previously derived estimates of actual expenditure for earlier years

19. There are many ways in which realisation factors can be applied to make predictions of actual expenditure for a future period. For instance, the adjusted estimates shown on page 1 of this publication were derived using realisation ratios which are the average of the latest available five observations. A range of realisation ratios for both type of asset and industry estimates is provided in Tables 4 and 5.

20. In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised in the application of realisation ratios. This is particularly the case with the twelve month expectations collected in the December and March surveys.

Description of terms

21. *New capital expenditure* refers to the acquisition of new tangible assets either on own account or under a *finance lease* and includes major improvements, alterations and additions. In general, this is expenditure charged to fixed tangible assets accounts excluding expenditure on second hand assets unless these are imported for the first time.

22. Some estimates are dissected by type of asset:
 (a) *New Buildings and Structures*. Includes industrial and commercial buildings, houses, flats, home units, water and sewerage installations, lifts, heating, ventilating and similar equipment forming an integral part of buildings and structures, land development and construction site development, roads, bridges, wharves, harbours, railway lines, pipelines, power and telephone lines. Also includes mine development (e.g. construction of shafts in underground mines, preparation of mining and quarrying sites for open cut extraction and other developmental operations primarily for commencing or extending production). Excludes purchases of land, previously occupied buildings and speculatively built

projects intended for sale before occupation.

(b) *Equipment, plant and machinery*. Includes plant, machinery, vehicles, electrical apparatus, office equipment, furniture, fixtures and fittings not forming an integral part of buildings, durable containers, special tooling, etc. Also includes goods imported for the first time whether previously used outside Australia or not. Excludes goods previously used in Australia.

Seasonal adjustment

23. The quarterly actual new capital expenditure series in this publication are affected to some extent by seasonal influences and it is useful to recognise and take account of this element of variation.

24. Seasonal adjustment may be carried out by various methods and the results may vary slightly depending on the procedure adopted. Accordingly, seasonally adjusted statistics are in fact only indicative and should not be regarded as in any way definitive. In interpreting seasonally adjusted data it is important therefore to bear in mind the methods by which they have been derived and the limitations to which the methods used are subject. Particular care should be taken in interpreting quarter to quarter movements in the adjusted series in the publication.

25. Seasonally adjusted estimates of new capital expenditure for the industry components of Total Manufacturing and Other Selected Industries are calculated and are available upon request. However, additional cautionary notes apply to these data.

26. At least once each year the seasonally adjusted series are revised to take account of the latest available data. The most recent reanalysis takes into account data collected up to and including the March quarter 1993 survey. Data for periods after March 1993 are seasonally adjusted on the basis of extrapolation of historical patterns. The nature of the seasonal adjustment process is such that the magnitude of some revisions resulting from reanalysis may be quite significant, especially for data for more recent quarters. For this reason, additional care should be exercised when interpreting movements in seasonally adjusted data for recent quarters.

27. It should be noted that the seasonally adjusted figures necessarily reflect the sampling and other errors to which the original figures are subject.

28. Details of the seasonal adjustment methods used together with selected measures of variability for these series are available on request.

Reliability of the estimates

29. Since estimates are based on data obtained from a sample rather than a complete enumeration, the data and the movements derived from them are subject to sampling variability; that is, they may differ from the figures that would have been obtained if all units had been included. One

measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of units was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors.

30. Another measure of sampling variability is the *relative standard error* which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling. The sample estimates of quarter to quarter movement in the value of new capital expenditure are also subject to sampling variability. The relative standard error of the estimate of movement is expressed as a percentage of the quarterly estimate of the level of capital expenditure. The relative standard errors for estimates of quarterly level and quarter to quarter movements are shown in Table 7. The estimates of movement between March and June quarters are subject to somewhat higher standard errors than those shown due to the annual revisions made to the sample of businesses selected.

31. The imprecision due to sampling, which is measured by the standard error, is not the only type of inaccuracy to which the estimates are subject. Other inaccuracies, referred to collectively as non-sample error, may occur for a number of reasons. The major ones of concern and which may affect the data are:

- (a) misreporting of data by respondents, and
- (b) deficiencies in the central register of economic units particularly in respect of small units.

Every effort is made to reduce the non-sample error to a minimum by careful design of questionnaires, efficient editing and operating procedures and appropriate methodology.

Comparability with National Accounts estimates

32. The statistics for new capital expenditure shown in this publication differ from estimates of private gross fixed capital expenditure shown in the Australian National Accounts for the following reasons:

- (a) National Accounts estimates incorporate data from other sources as well as information from the capital expenditure survey. For example, estimates for capital expenditure on 'equipment' are based on annual statistics of depreciable assets available from the Taxation Commissioner. Quarterly estimates are interpolated between and extrapolated from the annual taxation based estimates using a variety of indicators including this survey. The ABS's quarterly Building Activity Survey and Engineering Construction Survey are the main sources for estimating the National Accounts dwelling and non-dwelling construction items respectively.

- (b) National Accounts estimates include the capital expenditure by all private businesses including units classified to agriculture, forestry, fishing and hunting and community services industries and the capi-

tal expenditure on dwellings by households. Data for these sectors are excluded from this publication.

- (c) The National Accounts estimates include the value of work done on speculative construction projects as the work is put into place. The statistics in this publication, however, include full value of the speculative projects as new capital expenditure of the purchaser (if in scope), when the project is sold.

- (d) For equipment, the National Accounts estimates relate to acquisitions less disposals of all fixed tangible assets whereas the survey figures are acquisitions of new fixed tangible assets only.

For a more detailed explanation of the concepts and methods used in compiling the National Accounts estimates see *Australian National Accounts: Concepts, Sources and Methods* (5216.0).

For more information ...

The ABS publishes a wide range of statistics and other information on Australia's economic and social conditions. Details of what is available in various publications and other products can be found in the *ABS Catalogue of Publications and Products* available at all ABS Offices (see below for contact details).

Information Consultancy Service

Information tailored to special needs of clients can be obtained from the Information Consultancy Service available at ABS Offices (see Information Inquiries below for contact details).

National Dial-a-Statistic Line

0055 86 400

(Steadycom P/L, premium rate 25c/21.4 secs.)

This number gives 24-hour access, 365 days a year for a range of statistics.

Electronic Data Services

A large range of data is available via on-line services, diskette, magnetic tape, tape cartridge and CD ROM. For more details about our electronic data services, contact any ABS Office (see below).

Bookshops and Subscriptions

There are over 400 titles of various publications available from ABS bookshops in all ABS Offices (see below Bookshop Sales for contact details). The ABS also provides a subscription service through which nominated publications are provided by mail on a regular basis at no additional cost (telephone Publications Subscription Service toll free on 008 02 0608 Australia wide).
