PRIVATE NEW CAPITAL EXPENDITURE, AUSTRALIA ACTUAL AND EXPECTED EXPENDITURE TO JUNE 1995 DECEMBER QUARTER 1993 SURVEY

MAIN FEATURES

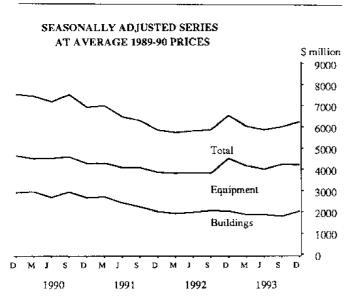

Estimates of new capital expenditure based on the complete December quarter survey confirm the situation indicated by the preliminary estimates released in Catalogue number 5625.0 on 1 March 1994.

Actual Expenditure December Quarter 1993

Estimates in seasonally adjusted 1989-90 price terms show that expenditure increased by 4% over the September quarter 1993 estimate. Expenditure on Buildings and Structures rose by 14%, the first quarterly rise recorded since September 1992. Expenditure on Plant and Equipment remained steady compared to the September 1993 survey.

% change on September qtr 1993

	Bldgs	Equip	Total
Average 1989-90 Prices			
- Seasonally Adjusted	14	-	4
Current Prices			
— Seasonally Adjusted	15	_	4
— Original	27	10	14

Seasonally adjusted current price estimates show that total expenditure rose by 4% over the September quarter. By broad industry groupings, changes were: Finance, Property and Business Services up 15%, Mining up 8%, Other Selected Industries up 3% and Manufacturing down 2%. Most of the increase in Finance, Property and Business Services and Mining is attributable to increased expenditure on Buildings and Structures.

Expected New Capital Expenditure 1993-94

The latest estimate of expected new capital expenditure for 1993-94 is \$27,526m which is 7% higher than the September quarter's revised estimate for the same period, and 4% higher than the corresponding expectation for 1992-93 from the December 1992 survey. Compared with the actual expenditure recorded for 1992-93, an increase of 6% is expected in expenditure on Plant and Equipment and a 10% increase in Buildings and Structures.

The table below shows possible percentage changes in new capital expenditure beween 1992-93 and 1993-94 using the relevant realisation ratios for the last completed year.

> % Change Expected Expenditure 1993-94 over Actual Expenditure 1992-93 (current prices)

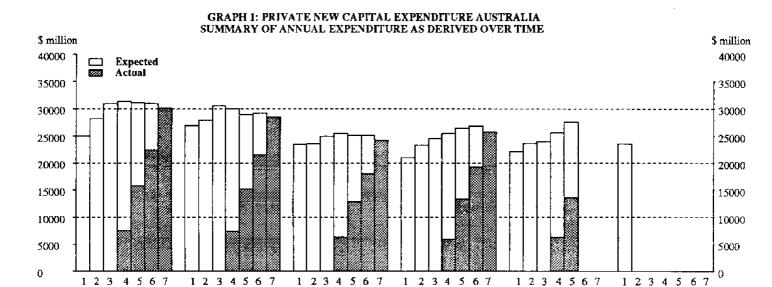

TOTAL	4
By Asset Building Equipment	-1 7

Expected New Capital Expenditure 1994-95
The first estimate of expected new capital expenditure for 1994-95 is \$23,549m. This is the highest first estimate since the one for 1990-91.

EXPLANATORY NOTES

Introduction

This publication contains estimates of actual and expected new capital expenditure by private businesses in Australia. The series contained in this publication have been compiled from data collected in a quarterly survey of private businesses.

2. These estimates replace and expand on the preliminary estimates previously published in *Private New Capital Expenditure Australia*, *Preliminary* (5625.0) released on 1 March 1994.

Scope of the survey

- 3. This survey aims to measure the value of new capital expenditure by private businesses in Australia. Private households and public sector businesses (ie all departments, authorities and other organisations owned or controlled by Commonwealth, State or Local Government) are outside the scope of the survey.
- 4. Because of various collection and compilation difficulties, the statistics in this publication exclude estimates relating to agriculture and community services industries. The construction industry data, whilst collected previously, has only been published since June quarter 1990. From the June quarter 1989, unincorporated non-employing units were excluded from the scope of the ABS central register of economic units. From that date, new businesses in this category were not added to the register. Units in this category which were already on the register have been deleted in various stages.

Methodology

5. This quarterly survey is based on a stratified random sample of private business units recorded on the ABS central register of economic units. The sample consists of approximately 8000 units. The figures obtained from the selected businesses are supplemented by data from units which have large capital expenditure and/or large employment and which are outside the sample framework, or not adequately covered by it.

Statistical unit

6. From the beginning of 1989, the ABS has introduced a new statistical unit known as the management unit. This unit is defined as:

the highest-level accounting unit within a business, having regard to industry homogeneity, for which accounts are maintained; in nearly all cases it coincides with the legal entity owning the business (ie company, partnership, trust, sole operator, etc). In the case of large diversified businesses, however, there may be more than one management unit, each coinciding with a 'division' or 'line of business'. A division or line of business is recognised where separate and comprehensive accounts are compiled for it.

7. The management unit is being implemented on the ABS central register of economic units and included in this survey as reporting arrangements are finalised. Where the management unit has not yet been implemented the statistical unit is still the operating legal entity as presently recorded on the ABS central register of economic units.

Classification by industry

- 8. In order to classify new capital expenditure by industry, each statistical unit (as defined above) is classified to the Australian Standard Industrial Classification (ASIC) industry in which it *mainly* operates.
- 9. The total value of all new capital assets acquired by each statistical uniteither on own account or under a finance lease is classified to the ASIC industry in which it mainly operates even though it may have activities in other industries.
- 10. The industries shown in this publication are detailed below. The numbers in brackets relate to the ASIC subdivisions as defined in the 1983 edition of ASIC.

MINING (11-16)

MANUFACTURING (21-34)

- Food, Beverages and Tobacco (21)
- Textiles, Clothing and Footwear (23,24)
- Paper and Printing, including paper, paper products, printing and publishing (26)
- Chemicals, Petroleum and Coal Products, including chemicals, fertilizers, paints, explosives, cosmetics, oil refining and coal products (27)
- Basic Metal Products (29)
- Transport Equipment (32)
- Fabricated Metal Products, including other industrial machinery and equipment and household appliances (31-33)
- Other Manufacturing, including wood, wood products and furniture (except sheet metal), glass, clay and other non metallic mineral products, and other manufacturing n.e.c. (25,28,34)

FINANCE, PROPERTY AND BUSINESS SERVICES (61-63)

OTHER SELECTED INDUSTRIES (36-59, 91-93)

- Electricity, Gas and Water including sewerage and drainage (36-37)
- Construction, including house and other residential and non-residential building, non building construction and special trade construction (41-42)
- Wholesale Trade (47)
- Retail Trade (48)
- Transport and Storage, including road, rail and air transport, shipping, stevedoring and storage (51-58)
- Other Non-Manufacturing, including communication, entertainment, recreation, restaurants, hotels and personal services (59, 91-93)

TOTAL INDUSTRIES, excluding public sector and all industries classified to Agriculture, Forestry, Fishing and Hunting, and Community Services.

Estimates at 1989-90 prices

11. Estimates at 1989-90 prices are presented, by type of asset, in seasonally adjusted terms in Table 3. The deflators used to revalue the current price estimates are the same as the price deflators compiled for the national accounts aggregates Private gross fixed capital expenditure on non-dwelling construction and Private gross fixed capital expenditure on equipment.

Sample revision

- 12. Each year the survey frame and the sample are revised prior to the June quarter survey to ensure that they remain representative of the survey population. In the course of this revision some of the business units from the sample strata are rotated out of the sample and replaced by others to spread the reporting workload equitably. As a check on comparability, information is collected from both the old and revised samples for the June quarter. In this publication, estimates derived from a June quarter survey are based on the newer of the two samples.
- 13. Estimates of level derived from the new sample may differ from estimates derived from the old sample. These differences are due to several factors including changes in the composition of the population and sample, reclassification of some statistical units to different industries and inadequate provisions in the old sample estimate for new businesses commencing during the year. Where differences have been found to be significant, adjustments have been made to data for prior quarters to minimise the impact on movements between March and June quarter survey estimates.

Timing and construction of survey cycle

14. Surveys are conducted in respect of each quarter and returns are completed in the 8 or 9 week period after the end

of the quarter to which the survey data relate (e.g. March quarter survey returns are completed during April and May). Full details of the reporting cycle are shown in the table below.

- 15. Businesses are requested to provide 3 basic figures each survey:
 - (a) Actual expenditure incurred during the reference period (Act)
 - (b) A short term expectation (E1)
 - (c) A longer term expectation (E2)
- 16. The design of the survey cycle readily facilitates formation of estimates of expenditure for financial years (12 months ending 30 June). For instance, as the table below shows, the first estimate for 1993-94 was available from the December 1992 survey as a longer term expectation (E2). It was subsequently revised in the March 1993 survey (again as a longer term expectation) and in the June 1993 survey as the sum of two expectations (E1 + E2). In the September and subsequent surveys the estimate is updated, being derived as the sum of actual expenditure (for that part of the year completed) and expected expenditure for the remainder of the year. Finally, the seventh estimate from the June quarter 1994 survey, will be derived by summing the actual expenditure for each of the four quarters.

Derivation and usefulness of realisation ratios

17. Once actual expenditure for a financial year is known, it is useful to investigate the relationship between each of the prior 6 estimates and that actual. The resultant realisation ratios (subsequent actual expenditure divided by expected expenditure) then indicate how much expenditure was actually incurred against the amount expected to be incurred at the various times of reporting. Realisation ratios

SURVEY OF PRIVATE NEW CAPITAL EXPENDITURE - REPORTING CYCLE

	IDA OI IA	XI 1 1 1 I I I	NEW CALL	71L/ L/XI	DITE	1121	·	LLI CAN	111101	<u> </u>	<u> </u>	
	Financial Year Estimate Obtained(a)		Period to which reported data relate(b)

Dec 93	5	1			ACT	AC		E1		E.	2	
Mar 94	6	2			ACT	AC.	ΓAC	T E1		E.	2	
June 94	7	3		:	ACT	AC	ΓAC	r Act	E	1	E2	

- (a) These numbers align with the numbers associated with financial year estimates shown in Graph 1 and Tables 4 and 5.
- (b) ACT represents actual expenditure for that quarter. E1 and E2 represent estimates of short term and longer term expected expenditure respectively.

can also be formed separately for 3 or 6 month expectations as well as the 12 month E2 estimates or combinations of estimates containing at least some expectation components (e.g. 6 months actual and 6 months expected expenditure).

- 18. Realisation ratios provide an important tool in understanding and interpreting expectations statistics for future periods. The application of realisation ratios enables the adjustment of expectations data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectations data and actual expenditure estimates. For example, if one wished to predict actual expenditure for 1993-94 based on the June 1993 survey results and compare this with 1992-93 expenditure, it is necessary to apply relevant realisation factors to the expectation to put both estimates on the same basis. Once this has been done the predictions can be validly compared with each other and with previously derived estimates of actual expenditure for earlier years
- 19. There are many ways in which realisation factors can be applied to make predictions of actual expenditure for a future period. For instance, the adjusted estimates shown on page 1 of this publication were derived using realisation ratios which are the average of the latest available five observations. A range of realisation ratios for both type of asset and industry estimates is provided in Tables 4 and 5.
- 20. In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised in the application of realisation ratios. This is particularly the case with the twelve month expectations collected in the December and March surveys.

Description of terms

- 21. New capital expenditure refers to the acquisition of new tangible assets either on own account or under a finance lease and includes major improvements, alterations and additions. In general, this is expenditure charged to fixed tangible assets accounts excluding expenditure on second hand assets unless these are imported for the first time.
- 22. Some estimates are dissected by type of asset: (a) New Buildings and Structures. Includes industrial and commercial buildings, houses, flats, home units, water and sewerage installations, lifts, heating, ventilating and similar equipment forming an integral part of buildings and structures, land development and construction site development, roads, bridges, wharves, harbours, railway lines, pipelines, power and telephone lines. Also includes mine development (e.g. construction of shafts in underground mines, preparation of mining and quarrying sites for open cut extraction and other developmental operations primarily for commencing or extending production). Excludes purchases of land, previously occupied buildings and speculatively built

projects intended for sale before occupation.
(b) Equipment, plant and machinery. Includes plant, machinery, vehicles, electrical apparatus, office equipment, furniture, fixtures and fittings not forming an integral part of buildings, durable containers, special tooling, etc. Also includes goods imported for the first time whether previously used outside Australia or not. Excludes goods previously used in

Seasonal adjustment

Australia.

- 23. The quarterly actual new capital expenditure series in this publication are affected to some extent by seasonal influences and it is useful to recognise and take account of this element of variation.
- 24. Seasonal adjustment may be carried out by various methods and the results may vary slightly depending on the procedure adopted. Accordingly, seasonally adjusted statistics are in fact only indicative and should not be regarded as in any way definitive. In interpreting seasonally adjusted data it is important therefore to bear in mind the methods by which they have been derived and the limitations to which the methods used are subject. Particular care should be taken in interpreting quarter to quarter movements in the adjusted series in the publication.
- 25. Seasonally adjusted estimates of new capital expenditure for the industry components of Total Manufacturing and Other Selected Industries are calculated and are available upon request. However, additional cautionary notes apply to these data.
- 26. At least once each year the seasonally adjusted series are revised to take account of the latest available data. The most recent reanalysis takes into account data collected up to and including the March quarter 1993 survey. Data for periods after March 1993 are seasonally adjusted on the basis of extrapolation of historical patterns. The nature of the seasonal adjustment process is such that the magnitude of some revisions resulting from reanalysis may be quite significant, especially for data for more recent quarters. For this reason, additional care should be exercised when interpreting movements in seasonally adjusted data for recent quarters.
- 27. It should be noted that the seasonally adjusted figures necessarily reflect the sampling and other errors to which the original figures are subject.
- 28. Details of the seasonal adjustment methods used together with selected measures of variability for these series are available on request,

Reliability of the estimates

29. Since estimates are based on data obtained from a sample rather than a complete enumeration, the data and the movements derived from them are subject to sampling variability; that is, they may differ from the figures that would have been obtained if all units had been included. One

measure of the likely difference is given by the *standard* error, which indicates the extent to which an estimate might have varied by chance because only a sample of units was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all units had been included, and about nineteen chances in twenty that the difference will be less than two standard errors.

- Another measure of sampling variability is the 30. relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occured due to sampling. The sample estimates of quarter to quarter movement in the value of new capital expenditure are also subject to sampling variability. The relative standard error of the estimate of movement is expressed as a percentage of the quarterly estimate of the level of capital expenditure. The relative standard errors for estimates of quarterly level and quarter to quarter movements are shown in Table 7. The estimates of movement between March and June quarters are subject to somewhat higher standard errors than those shown due to the annual revisions made to the sample of businesses selected.
- 31. The imprecision due to sampling, which is measured by the standard error, is not the only type of inaccuracy to which the estimates are subject. Other inaccuracies, referred to collectively as non-sample error, may occur for a number of reasons. The major ones of concern and which may affect the data are:
 - (a) misreporting of data by respondents, and
 - (b) deficiencies in the central register of economic units particularly in respect of small units.

Every effort is made to reduce the non-sample error to a minimum by careful design of questionnaires, efficient editing and operating procedures and appropriate methodology.

Comparability with National Accounts estimates

- 32. The statistics for new capital expenditure shown in this publication differ from estimates of private gross fixed capital expenditure—shown in the Australian National Accounts for the following reasons:
 - (a) National Accounts estimates incorporate data from other sources as well as information from the capital expenditure survey. For example, estimates for capital expenditure on 'equipment' are based on annual statistics of depreciable assets available from the Taxation Comissioner. Quarterly estimates are interpolated between and extrapolated from the annual taxation based estimates using a variety of indicators including this survey. The ABS's quarterly Building Activity Survey and Engineering Construction Survey are the main sources for estimating the National Accounts dwelling and non-dwelling construction items respectively.
 - (b) National Accounts estimates include the capital expenditure by all private businesses including units classified to agriculture, forestry, fishing and hunting and community services industries and the capi-

tal expenditure on dwellings by households. Data for these sectors are excluded from this publication.

- (c) The National Accounts estimates include the value of work done on speculative construction projects as the work is put into place. The statistics in this publication, however, include full value of the speculative projects as new capital expenditure of the purchaser (if in scope), when the project is sold.
- (d) For equipment, the National Accounts estimates relate to acquisitions less disposals of all fixed tangible assets whereas the survey figures are acquisitions of new fixed tangible assets only.

For a more detailed explanation of the concepts and methods used in compiling the National Accounts estimates see Australian National Accounts: Concepts, Sources and Methods (5216.0).

For more information ...

The ABS publishes a wide range of statistics and other information on Australia's economic and social conditions. Details of what is available in various publications and other products can be found in the ABS Catalogue of Publications and Products available at all ABS Offices (see below for contact details).

Information Consultancy Service

Information tailored to special needs of clients can be obtained from the Information Consultancy Service available at ABS Offices (see Information Inquiries below for contact details).

National Dial-a-Statistic Line

0055 86 400

(Steadycom P/L: premium rate 25c/21.4 secs.)

This number gives 24-hour access, 365 days a year for a range of statistics.

Electronic Data Services

Selections of most frequently requested statistics are available, updated daily, on Discovery (Key *656#). For more details on electronic data services available, contact Information Services in any of the ABS Offices (see Information Inquiries below for contact details).

Bookshops and Subscriptions

There are over 400 titles of various publications available from ABS bookshops in all ABS Offices (see below Bookshop Sales for contact details). The ABS also provides a subscription service through which nominated publications are provided by mail on a regular basis at no additional cost (telephone Publications Subscription Service toll free on 008 02 0608 Australia wide).
