

**QUARTERLY INDEXES OF INDUSTRIAL PRODUCTION, AUSTRALIA  
MARCH QUARTER 1994**

**MAIN FEATURES**

*NOTE: Recent trend estimates are provisional and could change when data for further quarters are available.*

**NEXT ISSUE:** The next issue of this publication is expected to be released on 31 August 1994.

Provisional trend estimates show that the index of industrial production continues to grow in the March quarter 1994. The trend in the index has now grown consistently over the two years from the March quarter 1992. The trend grew by 1.4 per cent in the March quarter 1994 following growth of 1.7 per cent in the December quarter 1993 and 1.5 per cent in the September quarter and is now 6.0 per cent above the March quarter 1993 estimate.

In the latest quarter two of the three component series, mining and utilities, showed very weak trend growth,

while manufacturing, the major component, grew strongly.

In seasonally adjusted terms a strong rise of 5.1 per cent in mining and a moderate rise of 1.9 per cent in manufacturing were slightly offset by a fall of 1.3 per cent in the utilities sector, to give 2.0 per cent growth for the industrial production index overall during the March quarter 1994. This follows a stronger rise (2.9%) in the December quarter 1993.

**INDEX OF INDUSTRIAL GROSS PRODUCT AT AVERAGE 1989-90 PRICES  
(BASE: 1989-90 = 100.0)**

(a) See paragraph 20 to 22 of the Explanatory Notes. Trend estimates for the most recent periods are provisional and could change when data for further quarters are available.

**INQUIRIES**

- for information about statistics in this publication and the availability of related unpublished statistics, contact Mr Mal Lawrie on Canberra (06) 252 7421 or any ABS State office.

## SUMMARY OF FINDINGS

*Components of the industrial production index**(i) Mining*

INDEX OF MINING GROSS PRODUCT (EXCLUDING SERVICES TO MINING)  
AT AVERAGE 1989-90 PRICES  
(BASE : 1989-90 = 100.0)

The provisional trend for the index of mining production rose marginally (up 0.2%) in the March quarter 1994, following successive falls (of 0.7% and 0.6% respectively) over the last two quarters of 1993. However, the trend estimate for the March quarter 1994 remains 1.1 per cent below that for the March quarter 1993.

*(ii) Manufacturing*

INDEX OF MANUFACTURING GROSS PRODUCT  
AT AVERAGE 1989-90 PRICES  
(BASE : 1989-90 = 100.0)

The trend in the index of manufacturing production has now grown consistently for two years, following three years of decline. Recent strong growth (2.5%, 2.6% and 2.1% respectively for the September, December 1993 and March 1994 quarters) means that the trend is now 9.0 per cent above that recorded in the March quarter 1993, confirming a strong recovery from the turning point in the March quarter 1992.

Nine of the twelve manufacturing subdivisions are showing trend growth, and three are showing declining trend production to the March quarter 1994. Recent movements in the estimates of gross product trend for each manufacturing subdivision are summarized below-

- *Food, beverages and tobacco* production has fallen over the latest two quarters following consistent growth for the previous nine quarters.
- The trend in *Textiles* production has declined strongly for the last nine quarters, particularly during the five quarters to September 1993. However, the rate of trend decline has slowed over the latest two quarters, and there are now early signs of the series flattening.
- *Clothing and footwear* production is showing strong growth over the last two quarters. However, this series has shown considerable volatility over recent quarters and users should be aware that the trend is provisional and subject to revision.
- Production in the *Wood, wood products and furniture* subdivision has declined moderately over the last four quarters. The trend in output of this subdivision has been generally one of decline since 1988.
- The trend for the index of *Paper, printing and publishing* gross product is showing strong growth in the last three quarters, confirming a turnaround

from the continuous decline between the March quarters 1991 and 1993. Since the March quarter 1993 the trend has risen by 12.6 per cent.

- *Chemical, petroleum and coal products* trend production has grown strongly over the last four quarters with a rise of 11.2 per cent for the year to March 1994.
- The production trend for the *Non-metallic mineral products* subdivision has shown strong growth over the last nine quarters although the rate of trend growth has slowed somewhat in the last three quarters. However, 8.8 per cent growth has been recorded over the last year.
- *Basic metal products* production has grown strongly for the last six quarters. The trend grew by 1.6 per cent in the March quarter 1994 and has grown by 12.2 per cent since the March quarter 1993.
- The trend in the index of *Fabricated metal products* gross product has risen consistently over the last six quarters from the turning point in the September quarter 1992. The trend has increased by 13.2 per cent since the March quarter 1993.
- Trend estimates for the index of *Transport equipment* gross product continue to show very strong growth over the last five quarters. This series grew by 4.9 per cent in the March quarter 1994 and has grown by 20.8 per cent, the strongest growth of all manufacturing subdivisions, over the last four quarters.

- The trend in the *Other machinery and equipment* production index has risen strongly over the last three quarters.
- The *Miscellaneous manufacturing* trend has grown continuously for six quarters, from the turning point in the September quarter 1992.

### (iii) Electricity, gas and water

The provisional trend for the index of gross product for the Electricity, gas and water sector displays very weak growth to the March quarter 1994. The trend grew by 0.1 per cent in each of the latest two quarters following slightly stronger growth over the previous four quarters.

NOTE: Explanatory Notes are published at the back of this publication.

## EXPLANATORY NOTES

**Introduction**

This publication presents in index number form, quarterly estimates of gross product at constant prices (average 1989-90 prices) for the non-farm, goods producing sector which, for brevity, is termed the 'industrial sector' (see paragraph 2). Also presented are indexes for component industries, including individual manufacturing subdivisions.

**Scope of the estimates**

2. The scope of the industrial sector referred to in this publication is defined to include all *establishments* classified to the Australian Standard Industrial Classification (ASIC) Division B (Mining), excluding ASIC subdivision 16 (Services to mining n.e.c.); Division C (Manufacturing); and Division D (Electricity, gas and water). The base year weights used in constructing the indexes in this publication have been derived from establishment data. However, the quarterly indicator series used for manufacturing are based on data relating to *business units* which may cover more than one establishment.

The table below sets out the base year weights associated with the major components of the industrial sector, and each manufacturing subdivision.

	1989-90 Weight %
Mining (excluding services to mining)	18.6
Manufacturing	67.8
Food, beverages and tobacco	14.0
Textiles	1.4
Clothing and footwear	2.2
Wood, wood products and furniture	3.5
Paper, etc, printing and publishing	6.4
Chemicals, petroleum and coal products	6.5
Non-metallic mineral products	3.4
Basic metal products	7.7
Fabricated metal products	5.2
Transport equipment	7.3
Other machinery and equipment	6.9
Miscellaneous manufacturing	3.3
Electricity, gas and water	13.6
<b>Total Industrial sector</b>	<b>100.0</b>

3. The use of Manufacturers' sales and stocks data means that the manufacturing indexes have three important limitations as measures of manufacturing production:

- (a) changes in quarterly production by manufacturing establishments of non-manufacturing businesses are not reflected in the indexes;
- (b) changes in a part of the quarterly production of non-manufacturing establishments of manufacturing businesses are reflected in the indexes; and
- (c) changes in quarterly production by government bodies such as shipyards and railway workshops are not reflected in the indexes.

4. The scope of the data used in the manufacturing indicator series also differs slightly from the general definition of manufacturing gross product. The stocks estimates used include finished goods bought in, but not manufactured, by a business. As far as can be assessed this has not had a significant influence on the estimates.

**Derivation of the estimates of gross product**

5. The estimates are derived using the *gross output* method whereby base year (1989-90) estimates of gross product are extrapolated by constant price estimates of gross output. All the quarterly indexes contained in this publication have been *benchmarked*, where possible, to annual estimates (see paragraph 6 below). For further details on the derivation of constant price gross product for individual industries refer to Chapter 18 in *Australian National Accounts : Concepts, Sources and Methods* (5216.0).

**Benchmarking**

6. Deriving quarterly estimates presents special problems in that it is often difficult to adhere strictly to the definitions and concepts used in annual estimates. Frequently, it is not possible to use the same data sources as used for annual estimates, and alternative quarterly data sources are generally much less detailed. For example, annual estimates of gross product for the Mining industry (as published in *Australian National Accounts : National Income and Expenditure* (5204.0)) are compiled (using the double deflation method) from detailed output and input data from the annual census of mining establishments. On the other hand, the quarterly series draw on the quantities of minerals mined (gross output), reported in surveys of mining establishments. In such cases, where the quarterly estimates are inferior to the annual, the quarterly estimates are adjusted to agree with the annual estimates in such a way that preserves, as far as practical, the movements of the quarterly series. This is commonly referred to as *benchmarking*.

**Data sources for quarterly output series***(i) Mining (excluding services to mining)*

7. Quarterly constant price output estimates are derived for major ASIC classes by quantity revaluation (i.e. quantities produced each quarter multiplied by associated base year (1989-90) average prices). Estimates of quantities produced are obtained from data contained in *Quarterly Mineral Statistics* (Australian Bureau of Agriculture and Resource Economics) and *Mineral Production, Australia* (8405.0). Constant price estimates of value added are derived by the gross output method (see paragraph 6) for each ASIC class. Total quarterly estimates of value added are then benchmarked (see paragraph 6) to annual gross product estimates obtained from the mining census.

*(ii) Manufacturing*

8. Quarterly constant price estimates of gross output for 22 manufacturing industry groups (excluding petroleum) are derived by summing constant price estimates of manufacturers' sales of manufactured goods, other operating revenue (where significant) and changes in the level of stocks of finished goods and work-in-progress.

9. Constant price estimates of all components of manufacturing output are derived by price deflation, i.e. current price components (obtained from the quarterly Survey of Stocks and Manufacturers' Sales) are derived by fixed weighted producer price indexes (published in *Price Indexes of Articles Produced by Manufacturing Industry, Australia (6412.0)*).

10. Quarterly petroleum production estimates are based on quarterly data published in *Major Energy Statistics* (released by the Department of Primary Industries and Energy).

11. Quarterly constant price estimates of output are used to derive constant price estimates of gross product at factor cost by the gross output method. The latter estimates are aggregated to 12 manufacturing ASIC subdivisions and then benchmarked to corresponding annual estimates of gross product at market prices (based on manufacturing census data).

#### (iii) Electricity

12. Quarterly quantities of electricity produced, as published in *Production of Energy Products, Australia (8368.0)*, are benchmarked to annual gross product estimates based on the quantity of electricity sold (published by the Electricity Supply Association of Australia in *The Electricity Industry of Australia*).

#### (iv) Gas

13. Quarterly quantities of gas available through mains, are published in *Production of Energy Products, Australia (8368.0)*, are benchmarked to gross product estimates derived from ABS economic census data relating to the performance of the gas production and distribution industry.

#### (v) Water and sewerage

14. Quarterly constant price output estimates are derived by quantity revaluation, i.e. quantities of water sold (to final consumers and for irrigation) and sewerage connections, are multiplied by average 1989-90 prices for each type of service. The quantity data are supplied by a selection of state and local government authorities. Quarterly output estimates are then benchmarked to annual constant price gross product estimates.

#### Sample revision

15. Each year the sample used for the survey of stocks and manufacturers' sales is revised. Differences between the old and revised samples have in general been apportioned back over the preceeding quarters of each year, and incorporated in the estimates included in this publication. For more information on the sample revision, refer to *Stocks and Manufacturers' Sales, Australia (5629.0)*.

#### Reliability of estimates

16. Because the measures used in the derivation of the manufacturing indexes are based on a sample survey, the indexes themselves are subject to sampling variability. In terms of original estimates the standard errors in percentage terms approximate the errors reported in *Stocks and Manufacturers' Sales, Australia (5629.0)*. However, for constant price estimates the standard errors may be up to

10 per cent higher than those for the corresponding current price estimates because of the sampling variability contained in the prices data used to deflate the current price estimates. Seasonally adjusting the estimates has an insignificant effect on standard errors.

17. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents and errors made in collecting and processing data. Inaccuracies of this kind are known as non-sampling errors and may occur in any collection, whether it be a sample or a full count. In addition to the non-sampling errors which may occur in current prices estimates, there may be non-sampling errors introduced by the process of compiling constant price estimates. These further errors may arise from the introduction of additional data and from the assumptions and approximations which are necessary in compiling constant price estimates. Every effort is made to minimise non-sampling errors by careful design of forms, editing of data and efficient operating procedures.

#### Seasonal adjustment

18. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series may be more clearly recognized. Seasonal adjustment procedures do *not* aim to remove the irregular or non-seasonal influences which may be present in any particular quarter, such as the effect of a major industrial dispute or major plant breakdowns. Irregular factors of this nature can make it difficult to interpret the movement of the series even after adjustment for seasonal variation.

19. Seasonal adjustment may be carried out by various methods and the results may vary slightly according to the procedure adopted. Accordingly, seasonally adjusted statistics should not be regarded as in any way definitive. In interpreting particular seasonally adjusted statistics it is important to note the methods by which they have been derived and the limitations to which the methods used are subject. Details of the various seasonal adjustment methods used are available on request.

#### Trend estimates

20. The seasonally adjusted series can be smoothed to reduce the impact of the irregular component in the adjusted series. There are a number of ways of accomplishing this, depending on the intended uses of the smoothed series. If importance is attached to measuring the underlying change in the most recent periods, moving averages employing appropriate weighting patterns should be adopted; the choice of averaging technique will determine the degree of smoothness of the derived series. For example, a 9-term moving average will even out more of the short term fluctuation in a series (and therefore appear 'smoother') than will a 5-term moving average. However, the longer the term of the moving average the longer the series affected by revisions resulting from more recent data becoming available. Such smoothed seasonally adjusted estimates are referred to as 'trend estimates' in this publication.

21. Trend estimates included in this issue are derived using a 7-term Henderson moving average. (The weights of the 7-term average are available upon request.) As a moving average approaches the end of a time series and begins to run out of observations, asymmetric averages have been used. Unlike the asymmetric weights of the standard 7-term Henderson moving averages, the weights employed here have been tailored to suit the particular characteristics of individual manufacturing subdivisions.)

22. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series — Estimates of 'Trend'* (1316.0) and *Time Series Decomposition — An Overview* (1317.0) for more detailed information on smoothing seasonally adjusted time series data.

#### Related publications

23. Users may also wish to refer to the following publications:

*Australian National Accounts : National Income and Expenditure* (5204.0) — issued annually

*Australian National Accounts : National Income and Expenditure* (5206.0) — issued quarterly

*Australian National Accounts : Concepts, Sources and Methods* (5216.0)

*Manufacturing Industry, Australia* (8221.0) — issued annually

*Mining Industry, Australia* (8402.0) — issued annually

*Price Indexes of Articles Produced by Manufacturing Industry, Australia* (6412.0) — issued monthly

*Production Bulletins* (8357.0 to 8363.0, 8367.0 to 8369.0) — issued quarterly

*Production Statistics, Australia, Preliminary* (8301.0) — issued monthly

*Stocks and Manufacturers' Sales, Australia* (5629.0) — issued quarterly

24. Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (1101.0). The ABS also issues on Tuesday and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The *Catalogue and Publications Advice* are available from any ABS office.
