### CHAPTER **1** MEASURING VICTORIA'S POPULATION .....

### FEATURE ARTICLE MEASURING VICTORIA'S POPULATION

### INTRODUCTION

Population estimates are one of the major outputs of any statistical office. They are critical for a wide range of planning and policy decisions. While population can be simply defined, such as the 'total number of persons living in an area', the concepts associated with its measurement are complex.

In Australia, the key population measure is estimated resident population (ERP), which is defined in terms of the number of people who usually live within Australia and its states and territories. The "usual residence" population concept refers to all people, regardless of nationality or citizenship, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. It includes usual residents who are overseas for less than 12 months and excludes overseas visitors who are in Australia for less than 12 months.

This article explains how the ABS derives ERP including the difference in the methodology used for national/state ERP and ERPs for geographic areas below the state level. The role of the Victorian regional office in producing these estimates is also discussed.

ESTIMATED RESIDENTThere are several legislative requirements for the ABS to produce population estimates.POPULATIONFor example sub-section 9(2) of the Census and Statistics Act 1905 requires the quarterly<br/>estimation of the population for each state.

ERP is used in legislative decision making such as determining the number of seats each state/territory has in the House of Representatives and as the relative distributional basis for Commonwealth grants to states/territories and local government authorities. ERP is also used for per capita measures such as fertility and mortality rates, survey benchmarks, federal electoral boundary redistribution and budget planning.

The ABS conducts a Census of Population and Housing every 5 years, however this does not provide information about a population's size and composition in the years between Censuses, defined as the 'intercensal period'. The initial Census year estimate is determined after a process called 'rebasing' which involves a number of steps:

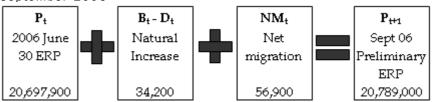

- obtaining place of usual residence data from the Census: in the Census usual residence means the address where a person has lived or intends to live for 6 months or more in the year of the Census (excluding overseas visitors in Australia for less than 12 months);
- adjusting for over or under enumeration;
- demographic adjustment;
- adjusting for residents temporarily overseas on Census night; and backdating to 30 June from Census night: this is necessary to get a consistent reference date for population estimates post Census.

ABS • STATE AND REGIONAL INDICATORS, VIC. • 1367.2 • MAR 2009 7

### ESTIMATED RESIDENT POPULATION continued

After establishing the 30 June Census year base, quarterly ERP over the intercensal period are calculated by ageing the base and then adjusting for subsequent components of population growth, i.e. adding natural increase (births minus deaths) and net overseas migration (estimated using passenger cards), and for the states and territories, net interstate migration (estimated using Medicare data). This method is known as the 'cohort component method' and uses the 'demographic balancing equation', which is recognised as the ideal approach for estimating population.

Quarterly updating of the population estimates for Australia, states and territories continues until the next Census results are available and the rebasing process is repeated to obtain a new starting point for the next intercensal period. The diagram below shows how population estimates are updated for one quarter.

QUARTERLY PRELIMINARY POPULATION ESTIMATE, Australia—30 September 2006

Note: The first release of the September 2006 estimate was based on the 2001 Census. When the June 2006 ERP was available as 'rebased' from the 2006 Census, the September 2006 ERP was recalculated from this new start population. Following this, the estimates undergo several revisions as more up-to-date data on births, deaths and migration becomes available. Statistics in the above diagram are the latest available.

The Census year ERP based on the current Census also provides a measure of how accurate the ERP was for the previous intercensal period. For example, the preliminary population estimate at 30 June 2006 calculated from the 2001 Census base using births, deaths and migration as described above was compared to the rebased June 30 estimate calculated from the 2006 Census. Using the cohort component method over the 5 years between 2001 and 2006 resulted in an underestimation of Australia's population. This difference is known as the 'intercensal error'.

After the intercensal error is determined, all quarterly ERP data for the previous intercensal period are revised using information from the Census on interstate migration and then spreading the remaining discrepancy evenly across the quarters. The initial revisions are 'preliminary rebased' estimates which are then updated again due to revision of the components in the intercensal period. The intercensal estimates are then updated once more to produce 'final rebased' ERP and no subsequent revisions are made after this process.

For further information on the rebasing process, see the Feature Article *Final Rebasing and Revision of Australia's Population Estimates, September Quarter 2001 - June Quarter 2006 in Australian Demographic Statistics*, Dec 2007 (cat. no. 3101.0).

### ESTIMATED RESIDENT POPULATION FOR STATISTICAL LOCAL AREAS

'Sub-state' or 'small area' population estimates relate to areas below the state/territory level of geographic disaggregation. They are widely used by all levels of government, as well as business and the community. Estimates are produced for statistical local areas (SLA) which build up to local government areas (LGA) and statistical divisions (SD). For further information, see *Australian Standard Geographic Classification (ASGC)*, July 2008 (cat. no. 1216.0).

While the cohort component method is considered the ideal method for estimating population in non-Census years, there are no reliable migration data at the SLA, level making it very difficult to estimate SLA population using natural increase and net migration.

The method used to compile Census date SLA population estimates is similar to that used for national and state/territory estimates. However, as the demographic balancing equation can not be applied for post-Census estimates, mathematical models are used instead.

The models establish relationships between changes in population and changes in population indicator data between the two most recent Censuses for groups of SLAs. Post-censal changes in these indicators are then used to estimate changes in the population of SLAs for the years following the most recent Census.

Population indicators are data that can be used to estimate total population change over time. They need to be:

- available for the entire estimation period;
- consistently defined; available at the relevant geographic level (or able to be converted to the relevant level) and;
- timely (available soon after the reference period).

Models are revised after each Census to ensure that the indicators used and the relationships established are providing the best outcome for SLA population estimation in each state/territory. Results from the 2006 Census enabled the ABS to develop new models for the 2007-2011 period. The most statistically robust model for each area is selected (i.e. the one that produces the 'best' estimates). This is the model which provided estimates for 2006 that are closest to the final (rebased) 2006 estimates.

DEVELOPING THE MODELS A number of factors are taken into account when determining the best models to use. For example, characteristics such as population growth rates may vary quite considerably between SLAs. In acknowledgment of these differences, SLAs within a state are separated into subsets (known as strata) based on factors such as location (urban or rural) and population growth (high or otherwise).

> More accurate estimates may then be calculated based on similarities existing within these subsets of SLAs and their relationship to particular combinations of indicators. Some indicators are more closely related to population change for some SLAs than others and usually a combination of indicators work better than a single indicator.

The selection of indicators varies across states and territories. For Victoria, the current set of models use indicator data from ABS dwelling approvals, Medicare enrolments and Australian Electoral Commission (AEC) enrolments.

#### CHAPTER 1 • MEASURING VICTORIA'S POPULATION

INDICATORS Dwellings (approvals)	Dwelling counts from the last Census are used as the base number of dwellings by SLA. Updated estimates of dwellings are prepared by adding approvals to the Census base. Dwellings approvals are divided into houses and flats/apartments, which generally have different building lag times. A 6 month lag is applied to housing approvals and 12 months for flats/apartments.
Medicare	Medicare enrolments for men, women and children are provided by postcode to the ABS by Medicare Australia. Generally, changes to the number of Medicare enrolments provide a reasonable indication of total population change.
	Again, there is an assumed discrepancy between the time a person moves and changes their address, therefore Medicare enrolments are lagged by 3 months from the reference date.
Australian Electoral Commission	Counts of people by sex on the Commonwealth electoral roll are provided to the ABS by the Australian Electoral Commission (AEC). The data are provided at collection district (CD) level and aggregated to the SLA level. AEC data are also lagged by 3 months and not all strata models use these data.
	Different weights are applied to each indicator in different models, as the relative importance of each indicator changes according to the stratum to which an SLA belongs. For example, births can have a greater impact on population growth in the fast growing suburban areas of Melbourne that are attracting families. Therefore the model used for these SLAs may give a greater weight to the number of children enrolled in Medicare. Similarly, some models may use AEC data while others don't, as this indicator may have a closer relationship to population change in some areas compared with others.
LIMITATIONS AND IMPLICATIONS	<ul> <li>Using the indicators to estimate change in population under various assumptions does have some limitations due to the time lag, coverage and quality of the indicator data sets:</li> <li>The length of lag time for dwelling approvals has been tested, however in some large building development projects a longer lag may occur;</li> <li>Accounting for permanent residents of serviced apartment buildings that were completed during the intercensal period is not incorporated in the models. Anecdotal evidence provided by state and local governments suggests that serviced apartment buildings in some inner Melbourne areas are being partially occupied by permanent residents. However, only approvals for residential buildings are used as inputs into models. Serviced apartment buildings are classified as 'non-residential buildings', therefore people who are usual residents of serviced apartments may not be directly picked up by the approvals data and may need to be accounted for in other indicator data;</li> <li>Even though people can only reside in occupied dwellings, the base dwellings count from the Census incorporates both occupied and unoccupied dwellings. This is consistent with the unknown eventual occupancy status of an approval. Using dwelling approvals as an indicator of population change assumes that the occupied/unoccupied ratio of approvals is the same as that of Census dwelling counts, which has limitations if the assumption does not hold over the estimation period;</li> </ul>

### LIMITATIONS AND IMPLICATIONS continued

- Medicare data are currently only available by postcode and converted to SLA using a concordance. The quality of the data is highly dependent on the quality of the postcode to SLA concordance;
- The models rely on the accuracy of datasets maintained for administrative purposes by Medicare and the AEC. While adjustments are made to the data such as applying a time lag to the reference period, there may still be implications for the statistical quality of the data;
- Undercoverage of some sub-populations. There are issues for enumerating some sub-sections of the population in the Census, which affect the base population for ERP. These population groups may also be under-represented in the indicator data. Overseas students are one example, which may have an impact on Victoria due to the large volume of overseas migration for study purposes. For example, areas around Inner-Melbourne present a particular issue for enumerating growing populations of overseas students. The AEC and Medicare indicator data set may not capture overseas students who are considered to be usual residents of Australia for the purpose of ERP. They may also be left out of the Census base count depending on how the question for usual residence is interpreted;
- In using models, we are making an assumption that the relationship between past population change and indicator data will continue into the future - if the relationship breaks down during the intercensal period then the models cannot account for it.

Aside from these known issues and limitations, the models are generally effective and accurate for the majority of SLAs. The use of Medicare and/or AEC along with dwelling approvals data goes some way to counteracting some of the problems described. However, awareness of indicator data characteristics and the potential impact on estimates within each state is a crucial part of producing local level ERP. Therefore, validation of ERP produced by the models is a significant part of the process for estimating resident population.

After initial estimates of SLA ERP are produced by models it is considered vital to confront the results against local knowledge. The models have limitations as discussed above, so incorporating expertise in the regional offices of the ABS not only allows for local intelligence to be drawn into the process but also allows a wider use of resources for increased scrutiny of the initial estimates.

The validation process undertaken within the Victorian office is a major exercise. Significant effort is placed on gathering supplementary data and information leading up to the validation and analysis phases, prior to receiving modelled ERP.

The growth and contribution of indicator data to the population is considered more closely using trend analysis over time, local knowledge of the area and a number of validation resources. The key resources used are:

- *ERP Local Government Authority Survey*; each year the Victorian Regional Office sends a survey to all local government councils requesting information relevant to population change within their Local Government Area for the previous year;
- Regional intelligence; throughout the year information is gathered from media reports to develop an understanding of current proposals, completions and delays in housing developments to assist in assessing the underlying dwelling approvals data;

ROLE OF THE ABS VICTORIAN REGIONAL OFFICE IN THE VALIDATION PROCESS

ROLE OF THE ABS VICTORIAN REGIONAL	<ul> <li>Consultation with state and local government agencies is undertaken as needed to further clarify the changes in population.</li> </ul>
OFFICE IN THE VALIDATION PROCESS continued	The models are used to estimate population for 200 SLAs in Victoria <sup>1</sup> , so assessing all of them in detail would involve a high overhead of resources and time; therefore efforts are concentrated on areas of significant change. The first stage of the validation process is to short-list SLAs which will be subject to more detailed scrutiny. During preparation, some of these are selected based on the results of regional intelligence, the ERP Local Government Authority Survey or other factors identified in previous validation rounds. To ensure that the majority of SLAs are selected based on the significance of change since the previous year's estimate, a validation tool is used, which performs a series of tests on the data. Based on these tests, particular SLAs are selected for detailed scrutiny.
	The validation data sources and local information may be used to adjust the modelled estimate for a particular SLA. The aim of validation is to account for population changes which may not be (directly or indirectly) picked up by the models. For example, a dwelling approval for a large block of flats may have been taken into account in the initial estimate of the ERP for an SLA. However, if local knowledge indicates that the building has not been completed and occupied within 12 months of the approval, the population estimate may need to be adjusted downwards.
	The Victorian Regional Office of the ABS regularly assesses validation sources and investigates others that may be useful in understanding population growth for small areas in Melbourne and Regional Victoria.
REVISING SLA POPULATION ESTIMATES	Part of the complex nature of estimating usual resident population is the revision cycle. To meet conflicting demands for accuracy and timeliness there are several versions of sub-state population estimates.
	For sub-state estimates, preliminary data are normally available nine to ten months after the reference date, so for the year ended June 30 the data are released by April the following year.
	Revised estimates are then provided 12 months later. This is because estimates at the SLA level are constrained to state/territory population estimates. When those estimates are revised following updates to components of natural increase, net overseas migration and net interstate migration at the state and territory level, the sub-state SLA populations are also adjusted to add to the revised state and territory totals.
	Preliminary Rebased and Final Rebased estimates are calculated after the next Census. Once a Census is held, new population estimates for each SLA at 30 June in the Census year are calculated as described above under 'Estimated Resident Population'. The models have also calculated preliminary 30 June SLA ERP for that year based on the previous Census, which allows an assessment of the performance of the models over the intercensal period. As a result, all ERP for all sub-state areas for the intercensal period are
	1 There are currently 210 SLAs in Victoria, however in areas where indicator data are unreliable and migration can be assumed to be insignificant, population change since the previous Cansus may be estimated by adding

. . . . . . . . . .

<sup>1</sup> There are currently 210 SLAs in Victoria, nowever in areas where indicator data are unreliable and migration can be assumed to be insignificant, population change since the previous Census may be estimated by adding estimates of natural increase (births minus deaths) since the previous Census. In some very small areas population change since the previous Census may be assumed to be zero in the absence of any reliable indicator data for these areas.

REVISING SLA POPULATION ESTIMATES	rebased by apportioning the intercensal error evenly across the 5 years, but constraining it to state/territory totals.
continued	A summary of the accuracy of the preliminary 2006 ERP is provided in paragraphs 12 to 15 of the Explanatory Notes of <i>Regional Population Growth, Australia</i> , 2007-08 (cat. no. 3218.0).
DATA AVAILABILITY	National and state/territory ERP is produced for each quarter and data are available five to six months after the reference date in <i>Australian Demographic Statistics</i> (cat.no.3101.0). The most recent release was for September quarter 2008, while ERP for the December quarter 2008 will be available in early June 2009.
	The ABS publishes small area ERP annually in <i>Regional Population Growth, Australia</i> (cat. no. 3218.0). The most recent publication, released in April 2009, provides ERP by SIA, LGA and SD for the 2007-08 financial year. ERPs for other geographical areas are available on request.
	ABS will also release an updated version of <i>Population Estimates: Concepts, Sources and Methods</i> (cat. no. 3328.0.55.001) in June 2009 which will provide further information on the ABS process for estimating resident population.

. . not applicable

— nil or rounded to zero (including null cells)

(a) Percentage change figures for components of population increase indicate the contribution of each component to the total population increase.

(b) Percentage change columns indicate the difference between the percentage rate for the reference period, and the percentage rate for the same period in the previous year. (c) Data relates to capital cities.

(d) The retail trade trend series have been suspended as at November 2008 as it is not possible to determine the trend in retail turnover through the period affected by the Federal Government Economic Security Strategy Package and other influences associated with global economic conditions. For further details refer to the December 2008 issue of Retail Trade, Australia (cat. no. 8501.0).

### CHAPTER **3**

### **POPULATION** ...

### ESTIMATED RESIDENT POPULATION

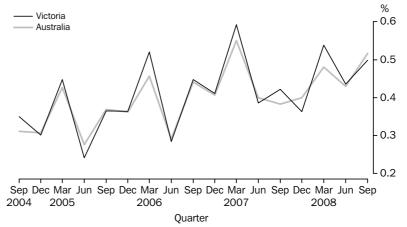

Victoria's Estimated Resident Population (ERP) at the end of any given period is the estimated population at the beginning of the period plus the sum of three components: natural increase, net overseas migration and net interstate migration.

At the end of September quarter 2008, Victoria's ERP was 5,340,300 people, an increase of 26,500 (0.50%) since the end of June quarter 2008. Over the same period, Australia's ERP grew by 110,700 (0.52%). Victoria's ERP increased by 97,000 (1.85%) over the 12 months since the end of September quarter 2007.

The largest component of Victoria's population growth in September quarter 2008 was net overseas migration (a gain of 17,900 people). Natural increase (births minus deaths) accounted for a further increase of 8,600 people.

Net interstate migration has historically meant loss of population from Victoria to other states and territories. In the preceding five years the only population gain from this source was recorded in March quarter 2006. Net interstate migration for Victoria in September quarter 2008 was zero.

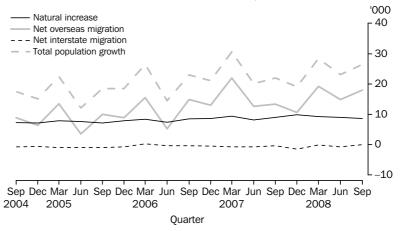

### QUARTERLY POPULATION GROWTH

ESTIMATED RESIDENT POPULATION continued

CHAPTER 4

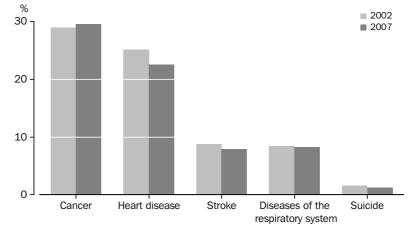

HEALTH .....

#### CAUSES OF DEATH

Statistics on causes of death are one of the oldest and most comprehensive set of health statistics available in Australia, and can provide insights into the impact of disease on Australian society. Causes of death are classified using the 10th revision of the International Classification of Diseases (ICD-10). The data presented in this chapter relate to the underlying cause of death, which is the disease or injury which initiated the train of morbid events leading directly to death. Other contributing causes and conditions reported on the death certificate are also recorded, but as associated causes. In accidental and violent deaths, the underlying cause is classified according to the circumstances of the accident or violence which produced the fatal injury, rather than to the nature of the injury.

In this chapter, 'Victorian deaths' relate to deaths of Victorian usual residents, regardless of where in Australia the death occurred and was registered, but also includes deaths registered in Victoria of persons usually resident overseas.

There were 33,930 Victorian deaths registered in Australia in 2007. This represented an increase of 158 deaths (0.5%) over the number registered in 2002. Almost 30% of deaths in 2007 were due to Cancer (Malignant neoplasms, ICD codes C00-C97) (29.5%, compared with 28.9% in 2002). The next most common underlying cause of death was Heart disease (ICD codes I05-I09, I11, I13, I20-I25, I27, I28, I30-I52) with 22.5% of deaths in 2007 (25.1% in 2002). Between 2002 and 2007, the number of deaths due to heart disease decreased by 10.0%, while deaths due to cancer increased by 2.7%. Stroke (Cerebrovascular diseases, ICD codes I60-I69), Diseases of the respiratory system (ICD codes J00-J99) and Suicide (Intentional self-harm, ICD codes X60-X84, Y87.0) were the underlying causes in 7.9%, 8.2% and 1.3% respectively of all deaths in 2007.

### CHAPTER 5

### HOUSING

### GOVERNMENT-OWNED SOCIAL HOUSING

At 30 June 2008, there were 71,720 government-owned dwellings for use as long-term social housing in Victoria, equating to 13.5 dwellings per 1,000 of the estimated resident population. The total number of dwellings decreased by 1,242 or 1.7% from a year previously.

Data were provided by the Victorian Department of Human Services in aggregate at the Local Government Area (LGA) level. It was not possible to derive exact data for Melbourne and Balance of Victoria Major Statistical Regions (MSRs) as the Yarra Ranges LGA is split across the two MSRs. In this chapter, the Yarra Ranges LGA as a whole was included with the other LGAs in the Melbourne MSR to form a region referred to as Melbourne Metropolitan Area (MMA). Consequently, the Balance of Victoria presented here excludes Yarra Ranges (S) - Pt B Statistical Local Area (SLA).

The MMA recorded a decrease of 1,011 dwellings (-2.0%) and the Balance of Victoria (BoV) a decrease of 231 dwellings (-1.0%). The majority of LGAs (53) recorded a decrease in dwellings between 2007 and 2008, while 18 recorded an increase. The number of dwellings did not change in the remaining 8 LGAs.

Within the MMA, the LGA of Yarra had the largest number of dwellings per 1,000 of the estimated resident population (59.5) followed by Port Phillip (34.2) and Moonee Valley (34.0), while Manningham and Nillumbik had the lowest (1.9 and 2.2, respectively). In the BoV, Wodonga recorded the highest number of dwellings per 1,000 of the estimated resident population (32.9) followed by Latrobe (26.3) and Warrnambool (25.0), while Golden Plains (0.2) had the lowest.

Between 30 June 2007 and 30 June 2008, the LGAs of Yarra (-330), Port Phillip (-155) and Darebin (-152) had the largest decrease in government-owned dwellings, while Greater Dandenong LGA had the largest increase (24). Outside the MMA, Mildura recorded the largest fall in dwellings (-34) and Moorabool had the largest increase (7).

CHAPTER **6** 

### WORK AND INCOME

LABOUR FORCE SURVEY SAMPLE SIZE REDUCTION	The sample size of the Labour Force Survey for July 2008 was reduced by 24% when compared with the June 2008 sample. The reduced sample is still representative, with selections made across all parts of Australia. However, there will be increased volatility in the estimates.
	This reduction affects most tables in the chapter.
	Detailed information about the sample reduction is provided in <i>Information Paper:</i> <i>Labour Force Survey Sample Design,</i> Nov 2007 (Second edition) (cat. no. 6269.0), which was released on 25 July 2008.
	From February 2009, labour force estimates are based on population benchmarks derived from the 2006 Census of Population and Housing. Additionally, estimates for the period June 2001 to January 2009 have been revised. These changes have had minimal impact on the key aggregates. For further details, please refer to the February 2009 issue of <i>Labour Force, Australia</i> (cat. no. 6201.0).
CIVILIAN LABOUR FORCE BY REGION	Between March 2008 and March 2009, the Victorian labour force increased by 43,700 people (1.6%). During this period, the number of employed people fell by 1,300 and the number of unemployed increased by 45,100 (35.9%). The Victorian unemployment rate increased from 4.5% to 6.0% over the same period.
	The labour force grew by 40,200 people $(1.9\%)$ in the Melbourne Major Statistical Region (MSR) and by 3,500 people $(0.5\%)$ in the Balance of Victoria MSR.
	The proportion of employed people who worked full-time fell from 70.5% to 69.9% in the Melbourne MSR and from 68.0% to 64.7% in the Balance of Victoria MSR.
	The number of unemployed people increased by 34,300 (36.6%) in the Melbourne MSR and by 10,600 (33.3%) in the Balance of Victoria MSR between March 2008 and March 2009. The labour force participation rate remained constant at 66.0% in the Melbourne MSR and fell from 62.3% to 61.7% in the Balance of Victoria MSR.
	Within the Balance of Victoria MSR, the Loddon-Mallee Statistical Region (SR) recorded the largest increase in employment (5,400), followed by the Central Highlands-Wimmera SR (700). The largest falls in employment were recorded in the Barwon-Western District SR (–5,700), the All Gippsland SR (–4,600) and the Goulburn-Ovens-Murray SR (–2,900).
EMPLOYED PERSONS BY INDUSTRY	In February quarter 2009, the largest proportion of people employed in the Melbourne MSR were in Manufacturing (12.2%), followed by Retail Trade (10.7%) and Health Care and Social Assistance (10.3%), while in the Balance of Victoria MSR the largest proportion of people were employed in Health Care and Social Assistance (12.8%), followed by Retail Trade (12.0%) and Manufacturing (11.1%).

. . . . . . . . .

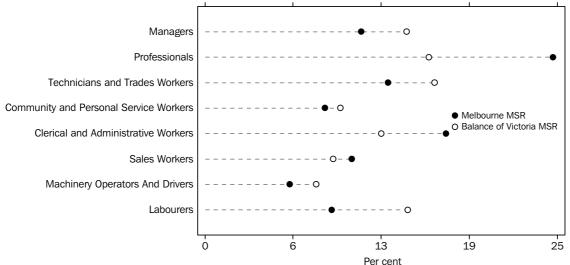

EMPLOYED PERSONS(a), By Industry(b), Major Statistical Regions-February Quarter 2009

. . . . . . . . . .

(a) Civilian population aged 15 years and over.(b) Data provided on ANZSICO6 basis.

EMPLOYED PERSONS BY INDUSTRY continued	In Victoria, Construction (88.6%) and Electricity, Gas, Water and Waste Services (83.2%) recorded the highest proportions of total males employed, while the highest proportions of total females employed were in Health Care and Social Assistance (83.3%) and Education and Training (69.3%) in February quarter 2009.
	In terms of full-time employment, Construction accounted for the highest proportion of males employed in Victoria (93.7%), and Health Care and Social Assistance accounted for the highest proportion of full-time females employed (77.8%).
	The largest proportion of male part-time workers were employed in Electricity, Gas, Water and Waste Services (71.8%). Rental, Hiring and Real Estate Services employed the largest proportion of part-time females (94.9%).
EMPLOYED PERSONS BY OCCUPATION	In February quarter 2009, in the Melbourne MSR, almost a quarter of people were employed as Professionals (24.7%), with Clerical and Administrative Workers (17.1%) and Technicians and Trades Workers (13.0%) being the next largest groups. In the Balance of Victoria MSR, the highest proportion of people were employed as Technicians and Trades Workers (16.3%) followed by Professionals (15.9%), Labourers (14.4%) and Managers (14.3%).
	Full-time workers in Victoria worked mainly as Professionals (25.0%), Technicians and Trades Workers (17.3%) and Clerical and Administrative Workers (15.2%), while part-time workers were mainly Sales Workers (19.4%), Professionals (16.8%) and Clerical and Administrative Workers (17.6%).

## PERCENTAGE CHANGE OF EMPLOYED PERSONS(a), By Occupation(b), Major Statistical Regions—February Quarter 2009

(a) Civilian population aged 15 years and over.

(b) Data provided on ANZSCO basis.

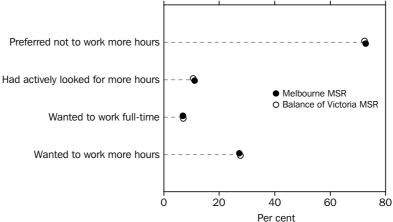

#### PART-TIME WORKERS

In February quarter 2009, there were 570,500 part-time workers in the Melbourne MSR. From February quarter 2008 to February quarter 2009, total part-time workers increased by 20,000 (3.6%) in the Melbourne MSR.

In February quarter 2009, females accounted for the majority of part-time workers (70.5%) in the Melbourne MSR. The majority of part-time workers (72.8%) preferred not to work additional hours, and this was a more common preference amongst females (75.7%) than males (66.0%).

In the Balance of Victoria MSR, the total number of part-time workers in February quarter 2009 was 234,600, an increase of 23,300 (11.0%) since February quarter 2008. The majority of these part-time workers (72.3%) preferred not to work more hours.

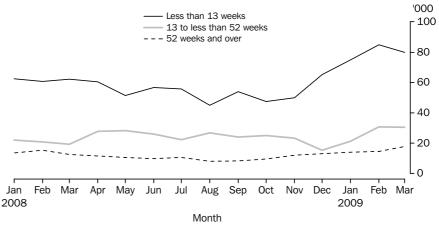

DURATION OF UNEMPLOYMENT Between March 2008 and March 2009, the number of people classified as short-term unemployed (less than 13 weeks) increased by 28.7% or 17,800 people in the Melbourne MSR and 31.0% or 5,400 people in the Balance of Victoria MSR.

### DURATION OF UNEMPLOYMENT continued

Over the same period, the number of people classified as medium-term unemployed (13 to less than 52 weeks) increased by 59.3% or 11,400 people in the Melbourne MSR and by 80.5% or 6,200 people in the Balance of Victoria MSR.

The number of people classified as long-term unemployed (52 weeks or more) increased by 41.6% or 5,200 people in the Melbourne MSR. For the Balance of Victoria MSR, the number of long-term unemployed decreased by 14.9% or 1,000 people, however this estimate is subject to a high relative standard error.

### PERSONS UNEMPLOYED, Melbourne MSR

### AVERAGE WEEKLY EARNINGS

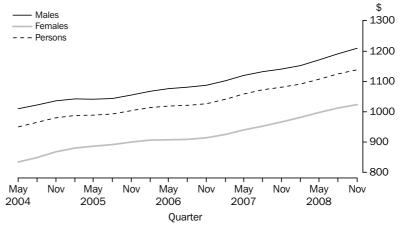

The definition of earnings currently used in the Average Weekly Earnings (AWE) survey is, broadly, current and regular payments in cash to employees for work done. Thus, earnings series from the AWE survey have historically excluded amounts salary sacrificed, as these have been considered conceptually as payments in kind. However, under the revised conceptual framework for measures of employee remuneration, as presented in *Information Paper: Changes to ABS Measures of Employee Remuneration* (cat. no. 6313.0), amounts salary sacrificed are now considered conceptually to be wages and salaries in cash.

### AVERAGE WEEKLY EARNINGS continued

. . . . . . . .

In November quarter 2008, the trend estimate of average weekly full-time adult ordinary time earnings in Victoria was \$1,138.40, an increase of 5.3% from November quarter 2007. Over the same period, trend full-time adult ordinary time earnings increased by 6.0% for males and by 5.9% for females.

## AVERAGE WEEKLY EARNINGS, Full-time adult ordinary time, Victoria: Trend

(a) Civilian population aged 15 years and over.

(b) The LGA data which appears here is aggregated from SLA data provided by the Department of Education, Employment and Workplace Relations (DEEWR).

(c) For methodology see Explanatory Notes in DEEWR publication Small Area Labour Markets, available from the DEEWR website.

(d) The majority of the Yarra Ranges (S) LGA is in the Melbourne Statistical Division (SD). However, the Yarra Ranges (S) — Pt B SLA is in the Gippsland SD. The estimates for the entire Yarra Ranges (S) LGA have been reported as part of Melbourne SD. Therefore, summing LGA estimates will slightly over-report the true estimate for Melbourne SD, and will slightly under-report the true estimate for Gippsland or Balance of Victoria.

(a) Movements in average weekly earnings can be affected by both changes in the level of earnings per employee and changes in the composition of the labour force. For example, changes in the proportions of full-time, part-time, casual and junior employees and variations in the distribution of occupations can affect movements in earnings series. For more information, see paragraphs 19 and 20 of the Explanatory Notes in the source publication.

### CHAPTER 7

#### STATE FINAL DEMAND .....

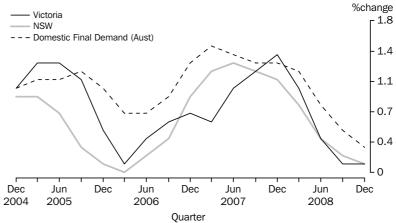

#### STATE FINAL DEMAND

State final demand is the estimate obtained by summing government final consumption expenditure, household final consumption expenditure, private gross fixed capital formation and the gross fixed capital formation of public corporations and general government.

In December quarter 2008, the trend estimate for Victorian final demand, in volume terms, was 66,192 million, an increase of 0.1% from September quarter 2008. This was the same as the trend growth for New South Wales (0.1%) and below the growth in Australian domestic final demand over the same period (0.3%).

Household final consumption expenditure is the largest component of state final demand, and accounted for 56.8% of the trend volume estimate of state final demand in December quarter 2008. The trend volume estimate of household final consumption expenditure decreased by 0.4% from September quarter 2008. This was the third consecutive quarterly decrease. In the past two decades the only other time there was a decrease was in the four quarters from June quarter 1990 to March quarter 1991. The other main contributors to trend state final demand in December quarter 2008 were private gross fixed capital formation (23.7%) and government final consumption expenditure (16.4%).

### CHAPTER 8

#### PRICE INDEXES .....

#### CONSUMER PRICE INDEX

Between December quarter 2008 and March quarter 2009, the All groups CPI for Melbourne increased by 0.2%. The groups which recorded the largest increases were Education (5.0%), Health (4.4%) and Food (2.2%). The groups which recorded decreases were Financial and insurance services (-6.6%), Transportation (-2.2%), and Recreation (-0.5%).

Between March quarter 2008 and March quarter 2009, the All groups CPI for Melbourne rose by 2.1%. The CPI All groups weighted average for the eight capital cities rose by 2.5% over the same period. The biggest annual increases for Melbourne were recorded in Food (6.1%), Health (5.4%) and Alcohol and tobacco (5.1%). The groups which recorded a decrease for the year were Transportation (–5.0%) and Financial and insurance services (–2.6%).

PERCENTAGE CHANGE OF CONSUMER PRICE INDEX, Melbourne—December quarter 2008 to March quarter 2009

 HOUSE PRICE INDEXES
 The price index for established houses covers transactions in detached residential

 dwellings on their own block of land regardless of age (i.e. includes new houses sold as a

 house/land package as well as second-hand houses). Price changes therefore relate to

 changes in the total price of dwelling and land.

Project homes are dwellings available for construction on an existing block of land. Price changes relate only to the cost of constructing the dwelling (excluding land).

During 2007 and 2008, the ABS undertook a review of the house price index. As a result, the housing stock weights have been updated using quantity data from the 2006 Census of Population and Housing and the method of stratification used to compile the index has been refined. For further details, please refer to the Appendix in the December 2008 issue of *House Price Indexes: Eight Capital Cities* (cat. no. 6416.0).

# HOUSE PRICE INDEXES continued

In December quarter 2008, the price of project homes in Melbourne decreased by 1.4% from the previous quarter. Based on preliminary estimates, the price of established homes decreased by 1.7% over the same period. Preliminary estimates of the weighted average of the eight capital cities showed a decrease of 0.8% in established house prices and an increase of 0.2% in project home prices in December quarter 2008.

From December quarter 2007 to December quarter 2008, established home prices in Melbourne decreased by 3.2% while project home prices rose by 1.8%.

CHAPTER 9

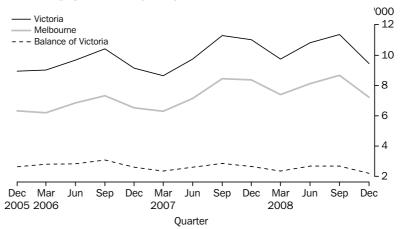

#### CONSTRUCTION

#### BUILDING APPROVALS

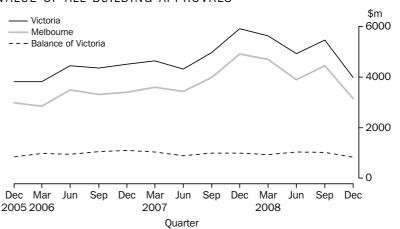

In December quarter 2008, there were 9,444 new dwelling units approved in Victoria, 1,911 less than in September quarter 2008 (a 16.8% decrease). In the Melbourne Major Statistical Region (MSR) there was a decrease of 16.7%, while in the Balance of Victoria MSR there was a decrease of 17.2%.

In the Melbourne MSR, the highest number of new dwelling units approved in December quarter 2008 were in the LGAs of Wyndham (824), Whittlesea (693) and Casey (577). Compared to the previous quarter, the largest fall in the number of new dwelling unit approvals was recorded in the LGAs of Stonnington (–242), Maribyrnong (–207) and Bayside (–145). The largest increases were recorded in the LGAs of Boroondara (161), Mornington Peninsula (71) and Moreland (54).

The total value of building approvals in Victoria was \$1,489.6m lower in December quarter 2008 than in the previous quarter.

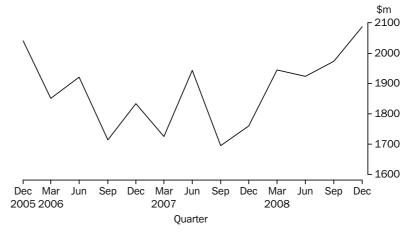

#### VALUE OF ALL BUILDING APPROVALS

#### ENGINEERING CONSTRUCTION ACTIVITY

For Victoria, the total value of engineering construction activity (work) done during December quarter 2008 was \$2,087.3 million, an increase of 5.8% from September quarter 2008. The overall increase in December quarter 2008 was mainly due to increases in the value of work done for Roads, highways and subdivisions (\$54.7m), Heavy Industry (\$44.5m), Telecommunications (\$25.9m), Recreation and other (\$22.6m) and Electricity generation, transmission etc. and pipelines (\$18.6m). The value of work done decreased for Water storage and supply, sewerage and drainage (-\$42.5m) and Bridges, railways and harbours (-\$10.1m).

### CHAPTER **10**

TOURISM

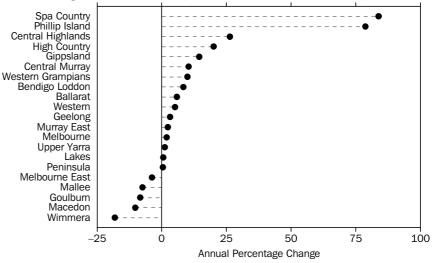

TOURIST ACCOMMODATION

. . . . . . .

In December quarter 2008, total accommodation takings for hotels, motels and serviced apartments in Victoria with 15 or more rooms were \$364.2m, an increase of 3.1% from December quarter 2007. The Melbourne Tourism Region accounted for the majority of Victoria's accommodation takings (78.3%).

The highest percentage growth in accommodation takings between December quarter 2007 and December quarter 2008 was recorded in the Tourism Region of Spa Country (83.8%), followed by Phillip Island (78.7%) and Central Highlands (26.3%). The largest decreases in accommodation takings were recorded in the Tourism Regions of Wimmera (-18.1%), Macedon (-10.2%) and Goulburn (-8.4%).

PERCENTAGE CHANGE OF TAKINGS FROM ACCOMMODATION(a), By Tourism Region—December Quarter 2007 to December Quarter 2008

#### AGRICULTURE

#### LIVESTOCK SLAUGHTERING AND MEAT PRODUCTION

CHAPTER **11** 

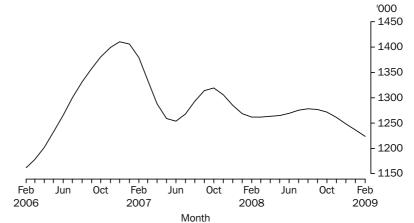

Between February 2008 and February 2009, the trend estimate for total meat production for Victoria increased by 2.4% from 57,807.5 tonnes to 59,184.6 tonnes. The production of Veal, Pig meat and Beef increased by 49.2%, 16.9% and 6.5% respectively, while decreases were recorded for Mutton (–25.4%) and Lamb (–1.5%) over the same period.

The trend estimate for numbers of livestock slaughtered decreased by 38,600 (3.1%) between February 2008 and February 2009. Slaughtering of Pigs, Calves and Cattle increased by 19.7%, 17.3% and 6.1.% respectively, while Sheep and Lamb slaughtering decreased by 20.5% and 0.6% respectively over this period.

### CHAPTER **12**

TRADE .....

#### CONFIDENTIALITY OF The release of statistics for certain merchandise trade commodities is restricted in order MERCHANDISE TRADE to prevent the identification of the activities of an individual business, where this is STATISTICS requested by the business concerned. These restrictions do not affect the total value of exports and imports for Australia, but they can affect statistics at disaggregated levels, including by state. Prior to September 2008, import commodities with confidentiality restrictions 'No commodity details' or 'No value details' contributed to the relevant state and country totals, so that these totals showed the correct level of trade. To ensure the confidentiality of data, this treatment changed in September 2008. Import commodities with these confidentiality restrictions are now excluded from all state-level data. Therefore, data on imports for Victoria may understate the actual amount of trade in Victoria, including the amount of trade with the state's major trading partners. From December 2008, some additional commodities have had a restriction of 'No commodity details' applied, and care should be taken when interpreting the data on Machinery and transport equipment in the commodity table in this chapter. BALANCE OF In February 2009, the balance of international merchandise trade (i.e. the value of MERCHANDISE TRADE exports less the value of imports) for Victoria was a deficit of \$2,336m. The value of the state's merchandise exports was \$1,607m, while merchandise imports totalled \$3,944m. Compared with February 2008, Victoria's trade deficit in February 2009 was \$535m (18.6%) lower, with a decline in the value of exports (down \$175m, 9.8%) being more than offset by a larger fall in the value of imports (down \$709m, or 15.2%). Victoria recorded an average monthly trade deficit of \$3,200m for the 12 months ending February 2008. At the national level, the value of imports was 0.2% lower in February 2009 than in February 2008, while the value of exports (including re-exports) was 38.8% higher between these two months.

#### BALANCE OF MERCHANDISE TRADE continued

BALANCE OF INTERNATIONAL MERCHANDISE TRADE, Exports minus Imports

For the year ended February 2009, Victoria's trade deficit was \$38,406m, an increase of \$4,617m (13.7%) over the year ended February 2008. A rise of \$5,595m (10.3%) in the value of the state's imports was partly offset by a rise of \$978m (4.8%) in the value of exports.

TRADE BY COMMODITYMore than a quarter of Victoria's exports (27.3%) in the year ended February 2009 were<br/>Food and live animals. Machinery and transport equipment was next, contributing 21.6%<br/>of total exports. Compared with the year ended February 2008, exports of Food and live<br/>animals rose \$931m, while Chemicals and related products, n.e.c. rose \$235m, and<br/>Mineral fuels, lubricants and related materials rose \$172m. The largest decreases in<br/>exports over the same period were in Machinery and transport equipment (- \$261m)<br/>and Beverages and tobacco (- \$101m).

In the year ended February 2009, imports of Machinery and transport equipment comprised 39.4% of total Victorian imports, more than twice the size of the next largest category (Miscellaneous manufactured articles, 15.9%). Increases were recorded in all of the import commodity categories when compared with the previous 12-month period. The largest increases were in Miscellaneous manufactured articles (\$1,151m), Mineral fuels, lubricants and related materials (\$1,015m) and Machinery and transport equipment (\$943m).

MAJOR TRADINGBased on the volume of trade with the state, Victoria's biggest trading partner in the yearPARTNERSended February 2009 was China, with combined exports and imports of \$13,127m. The<br/>next biggest trading partners were the United States of America, Japan, New Zealand and<br/>Germany. With the exception of New Zealand (a trade deficit of \$540m), Victoria's largest<br/>trade deficits in the year ended February 2009 were recorded with its biggest trading<br/>partners – China (\$8,813m), the United States of America (\$5,748m), Germany<br/>(\$3,580m) and Japan (\$3,514m). Over the same period, trade surpluses were recorded<br/>with 5 of the 30 countries listed in the major trading partners table. The largest of these<br/>was with Saudi Arabia (\$1,071m).

### CHAPTER **13**

#### ENVIRONMENT

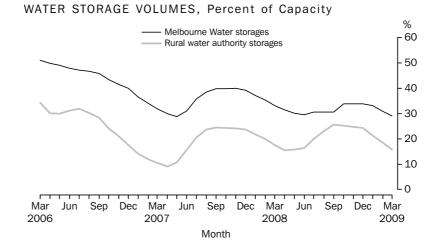

#### AIR QUALITY

The Air Quality Index compiled by the Victorian Environment Protection Authority measures the concentration of various pollutants relative to the concentration levels at which they may cause harm. The lower the index is, the better the quality of our air. The index is available for four areas in the Port Phillip Region (East, West, City and Geelong) and the Latrobe Valley.

The Visibility Pollutant Index is an indicator of visibility reduction, and is measured by the concentration of airborne particles relative to Victorian standards. Incidents of poor visibility are generally higher during the cooler months of Autumn and Winter (from May to September), whereas ozone levels are generally higher during the warmer months of Spring and Summer (from November to February).

WATER RESOURCESAt the end of March 2009, Victoria's water storages were at 16.1% of capacity. This was<br/>2.7 percentage points lower than the level in February 2009, and 1.4 percentage points<br/>lower than in March 2008.

Melbourne's water storage level at the end of March 2009 was 29.1% of capacity. This was 1.8 percentage points lower than the level in February 2009 and 4.1 percentage points lower than in March 2008. Rural water storages held 15.8% of their capacity at the end of March 2009, 2.7 percentage points lower than in February 2009, and 1.8 percentage points lower than the level in March 2008.

- (a) The Environment Protection Authority (EPA) reports air quality as an index for any given pollutant as its concentration expressed as a percentage of the relevant standard. It enables easy interpretation of whether the pollutant is at a level which may cause harm. An index value of 100 means the pollutant is currently at a concentration equal to the National Environment Protection Measure (Air NEPM) or State Environment Protection Policy (The Air Environment) (SEPP) standard levels (levels designed to protect human health and the environment). Indexes are calculated separately for each measured pollutant: Ozone, Nitrogen Dioxide, Sulfur Dioxide, Carbon Monoxide, Fine Particulates (PM10), Visibility (Airborne Particle Index). For each station, the daily pollutant indexes are the maximum index values for that day. Note that not all pollutants are measured at each station. The EPA also calculates an overall Air Quality Index, which amalgamates each pollutant index into an overall measure of air quality at each station.
- (b) Data have been provided for the Ozone and Visibility (or Airborne Particle) Indexes as these are the dominant pollutants and are widely measured across the EPA network. It should also be noted that meteorological conditions are a major determinant on the incidence of elevated pollutant levels. Hence significant daily, seasonal and annual variations can be expected in air quality. For more information on Air Quality, see the EPA web site, <http://www.epa.vic.gov.au>.
- (c) The index is converted into a qualitative scale with five commonly understood terms. Very Good (0–33), Good (34–66) and Fair (67–99) represent measurements within the standards, while Poor (100–149) and Very Poor (150+) represent measurements exceeding the standards.

(d) Data for the 'City' region are not available from December quarter 2006 due to the loss of a weather station.

(e) For reporting purposes the Port Phillip Region (PPR) has been divided into 4 regions: East, West, City and Geelong. Air monitoring stations assigned to each region are: East – Alphington, Brighton, Box Hill, Dandenong, Mooroolbark; City – RMIT, Richmond; West – Footscray, Melton, Point Cook, Paisley; Geelong – Point Henry, Geelong South. In addition, the Latrobe Valley has stations at Moe and Traralgon. The regional index is considered to be the maximum of the station indexes calculated within each particular region. The daily index reported for a region is the maximum region index recorded each day.

### GLOSSARY .....

Chain volume measures	Annually-reweighted chain Laspeyres volume price indexes referenced to the current price values in a chosen reference year (i.e. the year when the quarterly chain volume measures sum to the current price annual values). Chain Laspeyres volume measures are compiled by linking together (compounding) movements in volumes, calculated using the average prices of the previous financial year, and applying the compounded movements to the current price estimates of the reference year.
	Generally, chain volume measures are not additive. In other words, component chain volume measures do not sum to a total in the way original current price components do. In order to minimize the impact of this property, the ABS uses the latest base year as the reference year. By adopting this approach, additivity exists for the period following the reference year and non-additivity is relatively small for the years immediately preceding. A change in reference year changes levels but not growth rates, although some revision to recent growth rates can be expected because of the introduction of a more recent base year (and revisions to the current price estimates underlying the chain volume measures).
Deficit and surplus	A deficit occurs when the sum of all debit entries exceeds the sum of all credit entries, and a surplus occurs when the sum of all credit entries exceeds the sum of all debit entries. The term deficit (or surplus) can therefore be used in relation to various balances, e.g. balance of trade.
Duration of unemployment	The elapsed period to the end of the reference week since a person began looking for work, or since a person last worked for two weeks or more, whichever is the shorter. Brief periods of work (of less than two weeks) since the person began looking for work are disregarded.
Employed	<ul> <li>Persons aged 15 years and over who, during the reference week:</li> <li>worked for one hour or more for pay, profit, commission or payment in kind, in a job or business or on a farm (comprising employees, employers and own account workers);</li> <li>worked for one hour or more without pay in a family business or on a farm (i.e. contributing family workers);</li> <li>were employees who had a job but were not at work and were: <ul> <li>away from work for less than four weeks up to the end of the reference week;</li> <li>away from work for more than four weeks up to the end of the reference week and received pay for some or all of the four week period to the end of the reference week;</li> <li>away from work as a standard work or shift arrangement;</li> <li>on strike or locked out;</li> <li>on workers' compensation and expected to return to their job;</li> </ul> </li> <li>were employers or own account workers who had a job, business or farm, but were not at work.</li> </ul>
Part-time workers	Employed persons who usually worked less than 35 hours a week (in all jobs) and either did so during the reference week, or were not at work in the reference week.
Particles as PM <sub>10</sub>	Particles with an aerodynamic diameter of 10 micrometres or less.
Photochemical oxidants and ozone	'Photochemical oxidants' is the technical term for the type of smog found in Australian cities during the warmer months of the year. This type of smog can be invisible or it can appear as a whitish haze.

ABS • STATE AND REGIONAL INDICATORS, VIC. • 1367.2 • MAR 2009 71

Photochemical oxidants and ozone <i>continued</i>	Photochemical oxidants are formed when sunlight falls on a mixture of chemicals in the air. Ozone is one of the main photochemical oxidants. Other chemicals such as formaldehyde are also found and, like ozone, have adverse health effects. Environment agencies measure the level of ozone because it indicates the total amount of photochemical oxidants in the air. Cities that have abundant sunshine over periods of time, together with moderate winds and high temperatures, are most likely to experience high levels of photochemical oxidants.
	Ozone is a gas that is formed when nitrogen oxides react with a group of air pollutants known as 'reactive organic substances' in the presence of sunlight. The chemicals that react to form ozone come from sources such as: motor vehicle exhaust, oil refining, printing, petrochemicals, lawn mowing, aviation, bushfires and burning off. Motor vehicle exhaust fumes produce as much as 70% of the nitrogen oxides and 50% of the organic chemicals that form ozone. (Source: Australian Government Department of the Environment, Water, Heritage and the Arts, <a href="http://www.environment.gov.au">http://www.environment.gov.au</a> )
Re-exports	Re-exports are defined as goods, materials or articles originally imported into Australia which are exported in either the same condition in which they were imported, or after undergoing some minor operations (e.g. blending, packaging, bottling, cleaning and sorting) which leave them essentially unchanged. Included in international merchandise export statistics.
Seasonal adjustment	A means of removing the estimated effects of normal seasonal variations from economic time series so that the effects of other influences are obvious. Seasonal variations are the systematic (though not necessarily regular) intra-year movements of economic time series. These are often the result of non-economic phenomena, such as climatic changes and regular religious festivals (e.g. Christmas and Easter).
State final demand	Conceptually identical to domestic final demand at the national level (the sum of private and government final consumption expenditure and private and public gross fixed capital formation).
	National estimates are based on the concepts and conventions embodied in the System of National Accounts, 1993, but for regional (including state) estimates there is no separate international standard. Although national concepts are generally applicable to state accounts, there remain several conceptual and measurement issues that either do not apply or are insignificant nationally. Most of the problems arise in the measurement of gross state product for the transport and storage, communication services, and finance and insurance industries, where production often takes place across state borders. In these cases, a number of conceptual views can be applied to the allocation of value added by state. For more information, see chapter 28 of <i>Australian System of National Accounts: Concepts, Sources and Methods</i> (cat. no. 5216.0).
Trend estimates	Smoothing seasonally adjusted series produces a measure of trend by removing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson weighted moving average to the respective seasonally adjusted series. Readers are reminded that trend estimates are subject to revision as subsequent months' data become available.
Unemployed	<ul> <li>Persons aged 15 years and over who were not employed during the reference week, and:</li> <li>had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:</li> <li>were available for work in the reference week;</li> <li>were waiting to start a new job within four weeks from the end of the reference week, and could have started in the reference week if the job had been available then.</li> </ul>
