#### **NOTES**

FORTHCOMING ISSUES ISSUE RELEASE DATE

December 2003 17 February 2004 March 2004 10 May 2004

CHANGES IN THIS ISSUE Six additional tables are included in this issue. Topics covered are life

expectancy, causes of death, public hospital admissions and emergency patients and timeliness of elective surgery. These tables are not expected to be included in the next issue, but may be included in future issues as

further data becomes available. Tourist accommodation tables

(36 and 37) contain March 2003 quarter data as June 2003 quarter data

are not yet available.

As a result of changes in the industry, internet activity data by Statistical Division for March quarter 2003 are not published in this issue, but are available on request. For more detail, refer to the footnotes to Table 45.

EXPLANATORY NOTES The statistics shown are the latest available as at 6 October 2003.

Explanatory Notes in the form found in other ABS publications are not included in *State and Regional Indicators, Victoria*. Readers are directed to the Explanatory Notes contained in related ABS publications.

Vince Lazzaro

Regional Director, Victoria

#### MAIN FEATURES

STATE FINAL DEMAND

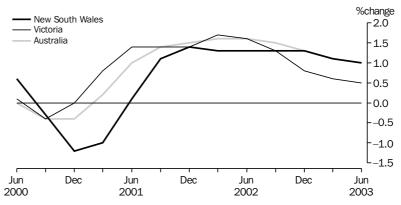

For the June quarter 2003, the estimate for state final demand (trend) in volume terms was \$47,304m (\$47b), an increase of 0.5% on the March quarter 2003, in real terms. Over the same period (March to June quarter 2003), the Australian estimate (domestic final demand) increased by 1.0%. In annual terms (June 2002 to June 2003), Victorian state final demand (trend) grew by 3.3%, while domestic final demand (trend) grew 5.0%.

STATE FINAL DEMAND, Chain volume measures — Change from previous quarter: Trend

In Victoria, growth for the last two quarters has been largely driven by Household final consumption expenditure. However growth has slowed from a peak of 1.7% (in March quarter 2002) to 0.5% (in June quarter 2003). In contrast, in New South Wales the growth rate in the trend series for state final demand has declined slightly since the December quarter 2002, to 1.0%.

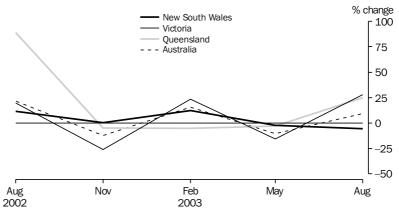

STATE FINAL DEMAND, Chain volume measures — Change from previous quarter: Trend

LABOUR FORCE

In August 2003, the estimated job vacancies in Victoria stood at 29,300 positions, up 27.9% from May 2003. The increase, in both the number of job vacancies and in percentage terms, was the highest recorded amongst all state and territories and significantly higher than its Australian equivalent at 9.3%. The increase in job vacancies for Victoria was entirely driven by the private sector up 6,800 (34.5%) with job vacancies in the public sector falling by 400 positions (12.5%).

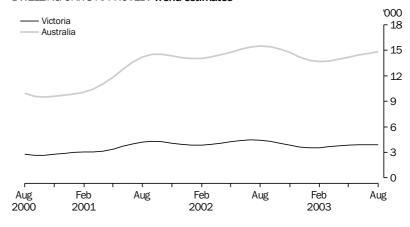

#### JOB VACANCIES, % change — Original

CONSTRUCTION

In August 2003, the trend estimate for the total number of dwelling units approved for Victoria was 3,884 dwellings, down 0.5% from the previous month. This is compared to the national estimate which increased by 1.4% on the previous month. The number of dwelling unit approvals for Victoria has decreased for the past two months, following increases in each of the five months prior to this.

#### DWELLING UNITS APPROVED: Trend estimates

The total value of Victorian building approvals (trend) was \$1,331.4m in August 2003, up 2.7% from July and 3.7% higher than in August 2002.

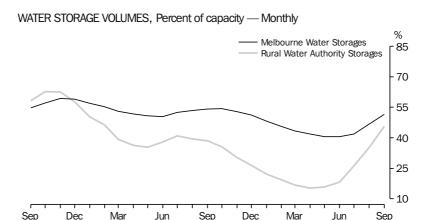

In the June quarter 2003 from the March quarter 2003, the price index for established homes in Melbourne rose 4.2%. The index for the 2002–2003 financial year rose by 11.7% compared to a rise of 21.7% for the 2001–2002 financial year. The index for project homes prices rose by 2.5% in the June quarter 2003 from the March quarter 2003 and 3.6% for the 2002–2003 financial year

RETAIL TURNOVER

Retail turnover in Victoria in August 2003 was \$3,593.2m in trend terms, up 0.5% from July 2003 and 5.8% from August 2002. National retail trade growth was 0.7% for the month and 6.3% for the year to August 2003. The fastest growing retail industries in Victoria, for the year to August 2003, were other retailing (Pharmaceutical, cosmetics etc.) 17.9% and department stores 8.7%. Recreational goods recorded the fastest decline of 12.4%.

#### WATER STORAGES

At the end of September 2003, Victorian water storages were at 46.7% of capacity, an increase of 10.0% from the end of August, and 3.8% higher than September 2002. Rural water storages at the end of September 2003 were at 45.5% of capacity, an increase of 19.3% over the previous two months. This contrasted with 2002 where rural water storages were 38.5% of capacity at the end of September, after a fall of 2.5% from July 2002. Melbourne water storages at the end of September 2003 were at 51.5% of capacity, an increase of 9.7% over the previous two months, and 2.6% less than the level recorded at the end of September 2002.

#### FEATURE ARTICLE

#### ESTIMATING WORKPLACE GROWTH FROM WORKCOVER DATA

**BACKGROUND** 

In response to demand from the Victorian government and other planners for more information on regional Victoria, the Australian Bureau of Statistics (ABS) undertook a study investigating the feasibility of using Victorian WorkCover Authority (VWA) data to construct estimates of regional workplace numbers (at 30 June 2000, 2001 and 2002) for the purpose of measuring workplace growth.

The VWA collects information about workplaces. A workplace is defined as an area occupied by an employer where workers work or pass through in the course of their employment. The postcode of the workplace is among the information collected, so it is possible to code workplaces to sub-state regions. As workers compensation is a compulsory requirement, the VWA data was expected to be of reasonable quality, and this had been borne out by an internal ABS study in 1999. For these reasons, it was decided to investigate the use of this data to produce workplace growth estimates. To enable regional and industry analysis, the estimates of growth were broken down by Statistical Division (SD), local government area (LGA) and by ANZSIC Division.

This article summarises the progress of this project ('the workplace growth project') to date, including a description of the methodology and a summary of the main findings.

The VWA estimates used in this project give information on:

- the number of VWA workplaces at 30 June for 2000, 2001 and 2002
- the annual change in number of workplaces
- and are broken down by Statistical Division (SD), local government area (LGA) and by industry (ANZSIC division).

There are some limitations to the use of VWA data. In particular, some of the largest businesses are not included, including Commonwealth employers, Commonwealth government trading enterprises, and the 36 "self insurers". In addition it is important to keep in mind that there is no necessary connection between the number of workplaces in the region and the performance and/or composition of those workplaces. For example, an increase in the number of workplaces could actually be associated with a decrease in the region's contribution to gross state product — if (say) many of the new workplaces were making a loss. Similarly a region such as the Melbourne CBD may contain a large number of head office corporations in contrast to a rural region which may be dominated by agricultural workplaces. Simple comparisons of changes in the number of workplaces between such disparate regions need to take these issues into consideration.

VWA DATA

#### **METHODOLOGY**

The population for the VWA data comprises all workplaces which employ workers and have annual remuneration greater than \$7500, and all workplaces (regardless of remuneration) which employ trainees or apprentices. Commonwealth employers and Commonwealth government trading enterprises are not included, as they are insured through Comcare. Sole traders, self employed and contractors are not generally included because they do not have employees. Self insurers are organisations approved by VWA to manage and be liable for their own workers compensation claims, therefore they are not covered. The 36 self insurers (for the 2000-01 financial year) were large corporations, representing 10% of total remuneration for all workplaces, making their omission significant.

The VWA dataset collects information about workplaces at the postcode level which can be concorded to local government area (LGA) geographical level for the purpose of measuring regional growth.

Two industry classifications for coding workplace activity are used by VWA. One of these, the industry activity code, can readily be converted to the Australian and New Zealand Standard Industrial Classification (ANZSIC), as used by the ABS.

Workplace 'deaths' are processed only once a year in practice, which negates the possibility of having a quarterly time series on net growth.

In the light of the above, it was decided to adopt the following scope criteria:

- Coverage to include workplaces employing workers with an annual remuneration greater than \$7500, and all workplaces employing trainees or apprentices.
- Exclusion of Commonwealth employers and Commonwealth government trading enterprises, self insurers, self employed and contractors.
- Geographic analysis on net growth to be at the LGA level.
- Industry analysis to be at the ANZSIC division level.
- Workplaces operating at 30 June of the financial year.

Unit record files were obtained from the VWA containing data for all workplaces registered with WorkCover for the 1999-2000, 2000-01 and 2001-02 financial years. The records were checked for consistency and errors in terms of coding to correct Victorian postcodes and identification of blank or missing values and other anomalies in the data. These anomalies amounted to less than one percent of all records and were removed from the total sum of workplace numbers.

METHODOLOGY continued

To concord the data from postcode to LGA level, population based concordances were applied. This introduces the crucial assumption that the distribution of human population and workplaces within any given LGA are the same. This assumption is a possible source of error in the estimates. For example, it is quite possible that an LGA boundary may cut across a postcode dividing household residences from a commercial business park. In this example, a population based concordance will incorrectly attribute all the workplaces to the LGA containing the population. In addition, the use of this concordance means the estimates of the number of workplaces can be fractional. However, given the absence of a business based concordance or any other alternatives, it is reasonable to use a population based concordance. Feedback from users about how the resulting estimates compare with their own knowledge will assist the ABS in assessing the effects of using this concordance.

The second concordance, provided by the VWA, linked VWA industry activity codes to ANZSIC divisions. This concordance associated each industry activity code with exactly one ABS ANZSIC division.

Once these processes were finalised, the data was merged for all LGAs and all industries as at 30 June 2000, 2001 and 2002. Net change was calculated between these points in time, in both absolute numbers and in percentage terms.

**ANALYSIS** 

Analysis was conducted for Victoria in total and for Melbourne and the Balance of Victoria. Analysis by local government area and by industry was also considered. A summary of the results are listed below.

Victoria

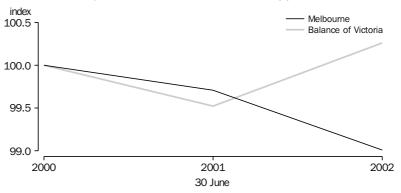

The total number of VWA workplaces across Victoria at 30 June 2002 was 212,207, compared with 212,845 at the same date in 2001, and 213,550 at 30 June 2000. This equated to a decrease of 0.3% during the 12 months ending 30 June 2002, following the same decline the previous year.

Melbourne and Balance of Victoria

Melbourne contained 152,999 workplaces at 30 June 2002. Melbourne saw a decline in the number of workplaces over both years studied, with a decrease of 1073 workplaces (0.7%) over the 12 months to 30 June 2002 following a fall of 453 workplaces (0.3%) the preceding year.

The Balance of Victoria Major Statistical Region (i.e. all of Victoria outside Melbourne) contained 58,882 workplaces at 30 June 2002, representing 27.7% of the state's total. This represented annual growth of 0.7% in 2001-02, in contrast to the preceding year where the number of workplaces had declined by 283 (0.5%).

WWA WORKPLACES, Number — All industries: Index values(a)

(a) Base is 100 at 30 June 2000.

Local Government Area

Workplace growth varied considerably between LGAs, and within LGAs between 2000–01 and 2001–02. Melbourne LGAs generally contained more workplaces than those in the balance of Victoria, and experienced larger changes in numeric terms. The following LGAs experienced the biggest increases in the number of workplaces in 2001–02:

LOCAL GOVERNMENT AREAS WITH GREATEST INCREASE IN WORKPLACES

	Increase in workplaces from 30	Increase in workplaces from 30 June 2001 to 30 June 2002				
Local Government Area	no.	%				
Melbourne						
Kingston (C)	219	3.6				
Maribyrnong (C)	192	7.9				
Melbourne (C)	153	1.2				
Hume (C)	133	2.8				
Balance of Victoria						
Murrindindi (S)	84	13.1				
Mildura (RC)	79	2.9				
Glenelg (S)	72	7.8				
Warnambool	72	5.9				

Within Melbourne, the greatest increase, in Kingston (C), was largely contributed by the Retail Trade, Construction and Wholesale Trade industries, which added 49, 45 and 45 workplaces respectively.

Maribyrnong (C) experienced the fastest relative growth in Melbourne (7.9%), adding a further 192 workplaces to the 2001 total. Property and Business Services, Retail Trade, and Health and Community Services significantly contributed to overall growth, with increases of 51, 42 and 35 workplaces respectively.

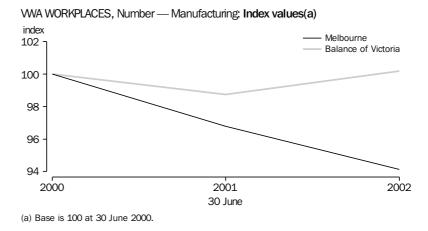

In the Balance of Victoria, the greatest increases in the number of workplaces over 2001–02 occurred in Murrindindi (S), Mildura (RC), Glenelg (S) and Warrnambool (C). In the fastest-growing of these LGAs, Murrindindi, Agriculture, Forestry & Fishing registered an increase of 25 workplaces (19.1%), whilst Construction recorded an increase of 15 workplaces (22.1%).

Analysis by Industry

Across Victoria, the Construction industry saw the largest increase in the number of workplaces in 2001–02, gaining a net 245 workplaces to reach a total of 23,593. This is reflected in the strong growth in housing and new approvals during the same period.

Communication Services experienced the most rapid relative growth of any industry, gaining 5.2% (25 workplaces) over 2001–02, and 15.2% (64workplaces) over the preceding 12 months.

Manufacturing workplace numbers grew strongly outside Melbourne (at a rate of 1.4%), compared with a growth rate of -2.7% in Melbourne, over 2001-02.

In summary, the number of workplaces in Victoria declined gradually from 2000 to 2002. The decline was not uniform across the state, with Melbourne experiencing a decline in workplace numbers (all industries) and Regional Victoria experiencing overall growth in workplace numbers (all industries). The study has shown there is a wide variation in growth patterns between LGAs and between different industries. The Construction industry experienced the most rapid growth although the number of Manufacturing and Wholesale Trade workplaces decreased significantly in both years.

VALIDATION OF RESULTS

The estimates have been compared against the ABS Business Register, the Australian Taxation Office (ATO) Australian Business Register (ABR), and experimental regional estimates produced from ATO sources. There are differences between the estimates from these different sources, but they are consistent with known differences in scope, coverage and concepts. There may be other quality problems with the VWA data which are not revealed by these comparisons, so the estimates will need to be verified against other sources and expert knowledge.

#### CONCLUDING COMMENTS

The main interest of the Victorian government in these estimates is to obtain more information about regional economies and the changes occurring in them. To this end, the growth recorded by the WorkCover data is of most interest. Because of the lack of other readily accessible data sources for measuring growth in regional business numbers, it is hard to validate the growth measures produced here against other data. However ATO business income tax and ABR data provide some reassurance that the growth estimates obtained from the WorkCover data are realistic.

One of the main attractions of using WorkCover data is the possibility of obtaining very detailed regional data, down to LGA level. The LGA estimates which have been produced show a high level of variation across LGAs and time periods. This does not appear to be due to any artefacts of the methodology employed, although this possibility should be further investigated.

Other possible sources of this variation are VWA processes (such as industry coding and timing of processing), and real-world variation in workplace behaviour in LGAs. By publishing selected estimates here, flagging their experimental status, the ABS is making them available to users to assess against their real-world knowledge, so that the quality of the estimates may be better understood.

<sup>(</sup>a) Civilian population aged 15 years and over. From April 2001 the Labour Force Survey was conducted using a redesigned questionnaire containing additional data items and some minor definitional changes. Although the impact on core labour force series has been minor, revisions have been made to estimates previously published to ensure continuity. The revised series were released on 3 May 2001. Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire (cat. no. 6295.0) contains further information about the questionnaire changes and the revised series. For details on the content of the redesigned questionnaire, see Information Paper: Questionnaires Used in the Labour Force Survey (cat. no. 6232.0).

<sup>(</sup>a) Civilian population aged 15 years and over. From April 2001 the Labour Force Survey was conducted using a redesigned questionnaire containing additional data items and some minor definitional changes. Although the impact on core labour force series has been minor, revisions have been made to estimates previously published to ensure continuity. The revised series were released on 3 May 2001. Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire (cat. no. 6295.0) contains further information about the questionnaire changes and the revised series. For details on the content of the redesigned questionnaire, see Information Paper: Questionnaires Used in the Labour Force Survey (cat. no. 6232.0).

<sup>(</sup>a) From April 2001 the Labour Force Survey was conducted using a redesigned questionnaire containing additional items and some minor definitional changes. Revisions have been made to core labour force estimates to ensure continuity. However, counts of employed persons by industry, being non-core data items, have not been revised. Thus data from April 2001 onwards are not strictly comparable with earlier unrevised data. Further information is contained in footnotes to Tables 6 and 7.

<sup>(</sup>a) Movements in average weekly earnings can be affected by both changes in the level of earnings per employee and changes in the composition of the labour force. For example, changes in the proportions of full-time, part-time, casual and junior employees and variations in the distribution of occupations can affect movements in earnings series. For more information, see paragraphs 17 and 18 of the Explanatory Notes in the source publication.

<sup>(</sup>a) Quarterly statistics on Victoria's production of gold, oil and gas are available in Australian Mineral Statistics, published by the Australian Bureau of Agricultural and Resource Economics.

Source: Australian Dairy Corporation; ABS data available on request, Wool Receivals and Purchases; ABS data available on request, Merchandise Exports; ABS data available on request, Poultry and Game Birds Slaughtered; National Electricity Market Management Company; ABS data available on request, Manufacturing Production Survey.

<sup>(</sup>b) Original series.

<sup>(</sup>c) Data from September quarter 2001 onwards are for Australia. For confidentiality reasons, State data are no longer available. The majority of whole milk powder production occurs in Victoria.

<sup>(</sup>d) Trend estimates for the most recent quarters are subject to revision when data for the subsequent quarters become available.

<sup>(</sup>e) Total metered generation of all generators in Victoria.

<sup>(</sup>f) Compiled from the ABS manufacturing production collection. Excludes details relating to both single establishment manufacturing enterprises with fewer than four persons employed, and establishments predominantly engaged in non-manufacturing activities which may also undertake some limited manufacturing activity. However, the effect of these establishments on production levels and movements is usually marginal.

<sup>(</sup>g) ANZSCC 375.01.01. Reported production of ready mixed concrete for sale as such. Excludes production used, or for use, in the same business. (An improvement in coverage for Melbourne Statistical Division from June month 2000 contributed approximately a 4% increase in the June month 2000 production level for Victoria).

<sup>(</sup>h) ANZSCC 312.03.01. Expressed as greenweight; excludes chips which are not sold or are used in own works.

<sup>(</sup>a) The EPA reports air quality as an index for any given pollutant as its concentration expressed as a percentage of the relevant standard. It enables easy interpretation of whether the pollutant is at a level which may cause harm. An index value of 100 means the pollutant is currently at a concentration equal to the National Environment Protection Measure (Air NEPM) or State Environment Protection Policy (The Air Environment) (SEPP) standard levels (levels designed to protect human health and the environment). Indexes are calculated separately for each measured pollutant: Ozone, Nitrogen Dioxide, Sulfur Dioxide, Carbon Monoxide, Fine Particulates (PM10), Visibility (Airborne Particle Index). For each station, the daily pollutant indexes are the maximum index values for that day. Note that not all pollutants are measured at each station. The EPA also calculates an overall Air Quality Index, which amalgamates each pollutant index into an overall measure of air quality at each station.

Source: Environment Protection Authority, Victoria.

<sup>(</sup>b) Data have been provided for the Ozone and Visibility (or Airborne Particle) Indexes as these are the dominant pollutants and are widely measured across the EPA network. It should also be noted that meteorological conditions are a major determinant on the incidence of elevated pollutant levels. Hence significant daily, seasonal and annual variations can be expected in air quality. For more information on Air Quality, see the EPA website, <a href="http://www.epa.vic.gov.au">.</a>.

<sup>(</sup>c) The index is converted into a qualitative scale with 5 commonly understood terms. Very Good (0-33), Good (34-66) and Fair (67-99) represent measurements within the health standards, while Poor (100-149) and Very Poor (150+) represent measurements exceeding the health standards.

<sup>(</sup>d) For reporting purposes the Port Phillip Region (PPR) has been divided into 4 regions: East, West, City and Geelong. Air monitoring stations assigned to each region are: East — Alphington, Brighton, Box Hill, Dandenong; City — RMIT, Richmond; West — Footscray, Mount Cottrell, Point Cook, Paisley; Geelong — Point Henry, Geelong South. In addition, the Latrobe Valley has stations at Moe and Traralgon. The regional index is considered to be the maximum of the station indexes calculated within each particular region. The daily index reported for a region is the maximum region index recorded each day.

Average number

Source: Internet Activity, Australia (cat. no. 8153.0).

Statistical Division (SD) where that ISP has a presence. Counts of ISPs reflect only those businesses operating at the end of the reference quarter.

<sup>(</sup>b) A Point of Presence (POP) is a server in a geographic location where an ISP can be accessed by a subscriber via access lines. Estimates for data at the State/Territory and Statistical Division levels are derived from data provided for POPs (Point of Presence or servers). Recently changing access technologies, infrastructure and operational arrangements have been impacting on the quality of data at the POP level. As a result, data at the Statistical Division level cannot be adequately quality assured and could present misleading indicators of regional activity and usage. However data at Statistical Division level are available on request from Peter Hodgson, telephone 1800 136 387 during business hours or via email on peter.hodgson@abs.gov.au.

<sup>(</sup>c) Lines, points, ports and modem access points available to subscribers to access their ISP.

<sup>(</sup>d) Subscribers and data downloaded have been apportioned to a SD according to the location of the POP where the activity took place.

<sup>(</sup>e) A megabyte (Mb) is a data unit of 1,048,576 bytes, sometimes interpreted as 1 million bytes. Volume of data downloaded figures relate to data downloaded during the three months of the reference quarter.

<sup>(</sup>f) Prior to March 2002, average data downloaded by Internet subscribers was calculated from the number of subscribers at the end of the reference period and the data downloaded over the three months of the reference period. In the current issue, this figure has instead been calculated from an estimate of the number of subscribers at the mid point of the reference period. Average figures are calculated using actual data as opposed to rounded figures.

<sup>(</sup>a) Data refer to the number of separations (number of patients discharged from hospital).

Source: Hospital Services Report March 2003, Department of Human Services, Victoria, <www.health.vic.gov.au/hsr>.

<sup>(</sup>b) Includes all emergency department patients, whether or not they were admitted to hospital.

<sup>(</sup>c) Provisional data.

<sup>(</sup>d) Includes both Austin and Repatriation campuses.

<sup>(</sup>e) Includes both Clayton and Moorabbin campuses.

<sup>(</sup>f) Dec 2002 and Mar 2003 data were incomplete, so estimates have been provided.

#### **GLOSSARY**

#### Chain volume measures

Annually-reweighted chain Laspeyres indexes referenced to the current price values in a chosen reference year (i.e. the year when the quarterly chain volume measures sum to the current price annual values). Chain Laspeyres volume measures are compiled by linking together (compounding) movements in volumes, calculated using the average prices of the previous financial year, and applying the compounded movements to the current price estimates of the reference year. Quarterly chain volume estimates are benchmarked to annual chain volume estimates, so that the quarterly estimates for a financial year sum to the corresponding annual estimate.

Generally, chain volume measures are not additive. In other words, component chain volume measures do not sum to a total in the way original current price components do. In order to minimise the impact of this property, the ABS uses the latest base year as the reference year. By adopting this approach, additivity exists for the quarters following the reference year and non-additivity is relatively small for the quarters in the reference year and the quarters immediately preceding it. The latest base year and the reference year will be advanced one year with the release of the June quarter data each year. A change in reference year changes levels but not growth rates, although some revision to recent growth rates can be expected because of the introduction of a more recent base year (and revisions to the current price estimates underlying the chain volume measures).

### **Duration of unemployment**

The elapsed period to the end of the reference week since a person began looking for work, or since a person last worked for two weeks or more, whichever is the shorter. Brief periods of work (of less than two weeks) since the person began looking for work are disregarded.

#### **Employed**

Persons aged 15 years and over who, during the reference week:

- worked for one hour or more for pay, profit, commission or payment in kind, in a job or business or on a farm (comprising employees, employers and own account workers)
- worked for one hour or more without pay in a family business or on a farm (i.e. contributing family workers)
- were employees who had a job but were not at work and were:
  - away from work for less than four weeks up to the end of the reference week
  - away from work for more than four weeks up to the end of the reference week and received pay for some or all of the four week period to the end of the reference week
  - away from work as a standard work or shift arrangement
  - on strike or locked out
  - on workers' compensation and expected to return to their job

**Employed** continued

 were employers or own account workers who had a job, business or farm, but were not at work.

**Part-time workers** 

Employed persons who usually worked less than 35 hours a week (in all jobs) and either did so during the reference week, or were not at work in the reference week.

Particles as PM<sub>10</sub>

Particles with an aerodynamic diameter of 10 micrometres or less.

Seasonal adjustment

A means of removing the estimated effects of normal seasonal variations from economic time series so that the effects of other influences are obvious. Seasonal variations are the systematic (though not necessarily regular) intra-year movements of economic time series. These are often the result of non-economic phenomena, such as climatic changes and regular religious festivals, e.g. Christmas and Easter.

State final demand

Conceptually identical to domestic final demand at the national level (the sum of private and government final consumption expenditure and private and public gross fixed capital formation).

National estimates are based on the concepts and conventions embodied in the System of National Accounts, 1993, but for regional (including State) estimates there is no separate international standard. Although national concepts are generally applicable to State accounts, there remain several conceptual and measurement issues that either do not apply or are insignificant nationally. Most of the problems arise in the measurement of gross state product for the transport and storage, communication services, and finance and insurance industries, where production often takes place across State borders. In these cases, a number of conceptual views can be applied to the allocation of value added by State. For more information, see chapter 28 of Australian System of National Accounts: Concepts, Sources and Methods (cat. no. 5216.0).

**Trend estimates** 

Smoothing seasonally adjusted series produces a measure of trend by removing the impact of the irregular component of the series. The trend estimates are derived by applying a 13-term Henderson weighted moving average to the respective seasonally adjusted series. Readers are reminded that trend estimates are subject to revision as subsequent months' data become available.

Unemployed

Persons aged 15 years and over who were not employed during the reference week, and:

- had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:
  - were available for work in the reference week
  - were waiting to start a new job within four weeks from the end of the reference week, and could have started in the reference week if the job had been available then.

## FOR MORE INFORMATION...

INTERNET www.abs.gov.au the ABS web site is the best place to

start for access to summary data from our latest publications, information about the ABS, advice about upcoming releases, our catalogue, and Australia Now—a

statistical profile.

LIBRARY A range of ABS publications is available from public and

tertiary libraries Australia-wide. Contact your nearest library to determine whether it has the ABS statistics you require, or visit our web site for a list of libraries.

CPI INFOLINE For current and historical Consumer Price Index data,

call 1902 981 074 (call cost 77c per minute).

DIAL-A-STATISTIC For the latest figures for National Accounts, Balance of

Payments, Labour Force, Average Weekly Earnings, Estimated Resident Population and the Consumer Price Index call 1900 986 400 (call cost 77c per minute).

#### **INFORMATION SERVICE**

Data which have been published and can be provided within five minutes are free of charge. Our information consultants can also help you to access the full range of ABS information—ABS user-pays services can be tailored to your needs, time frame and budget. Publications may be purchased. Specialists are on hand to help you with analytical or methodological advice.
