Australian Capital Territory	312.4	2.4	0.8
Australia	19 277.1	225.1	1.2

DECEMBER QTR KEY POINTS
ESTIMATED RESIDENT POPULATION

- The preliminary estimated resident population of Australia at December 2000 was 19,277,100 persons. The population increased by 225,100 persons since December 1999 and 58,000 persons since September 2000.
- Natural increase for the year ended December 2000 was 120,600 persons, a decline from 121,500 persons in the year ended December 1999.
- Preliminary net overseas migration was 104,500 persons in the year ended December 2000, compared with 88,400 in the year ended December 1999.

POPULATION GROWTH RATES

- For the year ended December 2000 Queensland recorded the highest growth rate (1.7%) while Tasmania's growth rate was negative (-0.1%). The national rate was 1.2%, higher than the rate for the year ended December 1999 (1.1%).

SPECIAL ARTICLES

- Interstate migration 1999–2000—Queensland and Victoria were the only two States or Territories to have a net gain of persons from interstate migration during 1999–2000. Queensland had the largest gain.
- Permanent and long-term movement to Australia—In 1999–2000 net long-term movement overtook net permanent movement as the major contributor to net overseas migration. Prior to 1999–2000 permanent movement had made the highest contribution throughout the 20th Century.

AUSTRALIAN HISTORICAL POPULATION STATISTICS

Australian Historical Population Statistics (ABS Cat. no. 3105.0.65.001) was released on 26 April 2001 as an electronic product only in ABS's AusStats. It contains a wide range of time series demographic data in computer spreadsheet form going back, where possible, to the beginnings of European settlement of Australia. Statistics are included on population size and growth, population distribution, population age-sex structure, births, deaths, migration, marriages and divorces.

A total of 103 spreadsheets are provided in the initial release and a complete listing is on the ABS website <<http://www.abs.gov.au>>. From the navigation bar select Themes; Demography; Australian Historical Population Statistics.

.....

CHANGES IN THIS ISSUE

Special arrangements were put in place to estimate net overseas migration for September and December Quarters 2000, and thereby enable production of State and Territory population estimates. Data from passenger cards completed by persons arriving in or departing from Australia, together with other information available to the Department of Immigration and Multicultural Affairs (DIMA), serve as a source for statistics on overseas migration. DIMA is currently automating the processing of passenger cards and the ABS has yet to receive relevant data.

Estimates of net overseas migration for September and December Quarters 2000 are based upon a sample of passenger cards from persons arriving in and departing from Australia during the period August through December 2000, along with movement data supplied by DIMA. Further information is available in *Demography Working Paper 2001/1—Estimating July to December 2000 Net Overseas Migration*, available on the ABS Website <<http://www.abs.gov.au>>. From the navigation bar select Themes; Demography; ABS Demography Working Papers.

As category jumping data are not yet available for September and December Quarters 2000, preliminary category jumping has been set to zero.

All household estimates have been revised to incorporate a statistical smoothing technique which reduces volatility but retains the trend of the time series. Further information is available in *Demography Working Paper 2001/3—Improving Household Estimates*, available on <<http://www.abs.gov.au>>. From the navigation bar select Themes; Demography; ABS Demography Working Papers.

.....

FINAL DATA

All ERP, natural increase, net overseas and net interstate migration and estimated resident household data prior to September Quarter 1996 are final.

Marriages and divorces data prior to March Quarter 2000 are final.

.....

REVISED DATA

Household estimates for 1995 to 1999 have been revised.

.....

PRELIMINARY DATA

All data from September Quarter 1999 are preliminary for ERP, natural increase, net overseas and net interstate migration.

Marriages and divorces data are preliminary for all quarters in 2000.

.....

A N A L Y S E S A N D C O M M E N T S

AUSTRALIA'S POPULATION

The preliminary estimated resident population (ERP) of Australia at December 2000 was 19,277,100 persons, an increase of 225,100 persons since December 1999 and 58,000 persons since September 2000. The national growth rate during the 12 months ended December 2000 was 1.2%, higher than the growth rate for the preceding 12 months (1.1%). Just over half (54%) of this growth rate resulted from the excess of births over deaths with the balance from net overseas migration.

COMPONENTS OF AUSTRALIA'S POPULATION CHANGE

The two components contributing to change in the Australian population are natural increase (the excess of births over deaths) and net overseas migration (net permanent and long-term movement plus an adjustment for category jumping¹). During the 20th Century natural increase has consistently made a higher contribution to population growth than net overseas migration.

Natural increase

In the year ended December 2000 natural increase was 120,600 persons, a decrease of 900 persons on the number recorded in the year ended December 1999 (121,500). Births contributed 248,900 babies while deaths removed 128,300 people from the population.

In the December Quarter 2000 natural increase was 29,900 persons, an 8% increase on September Quarter 2000 (27,800) and a 6% decrease on December Quarter 1999 (31,800).

Net overseas migration

Due to the unavailability of complete passenger card based overseas arrivals and departures data from the Department of Immigration and Multicultural Affairs (DIMA), September and December Quarters 2000 net overseas migration data have been estimated from a sample. Category jumping has been set to zero for the two quarters. For further information on the method of estimation please see 'changes in this issue' on the notes page of this publication.

Preliminary net overseas migration increased by 18% (16,100 persons) from 88,400 in the year ended December 1999 to 104,500 in the year ended December 2000. Net overseas migration in the year ended December 2000, comprised 318,700 permanent and long-term arrivals, 203,400 permanent and long-term departures and for the first six months of the year 2000 a preliminary estimate of -10,800 category jumpers.

For the second successive calendar year net long-term movement (63,200 in the year ended December 2000) made a higher contribution to net overseas migration than net permanent movement (52,100 in the year ended December 2000). Prior to the year ended December 1999 net permanent movement had, during the whole of the 20th Century, made the highest contribution to net overseas migration.

In the December Quarter 2000 preliminary net overseas migration was 28,100 persons, an 18% decrease on September Quarter 2000 (34,300) and a less than 1% increase on December Quarter 1999 (28,000).

POPULATION OF AUSTRALIA'S STATES AND TERRITORIES

The population of Australia's States and Territories at December 2000 was as follows: New South Wales 6,502,600, Victoria 4,797,400, Queensland 3,597,200, South Australia 1,500,500, Western Australia 1,897,400, Tasmania 470,100, Northern Territory 196,300, and the Australian Capital Territory 312,400.

INTERSTATE MIGRATION

While natural increase and net overseas migration affect the population growth of Australia's States and Territories these populations are also influenced by interstate migration. Historically, mobility in Australia has been high and volatile. Interstate migration in Australia is unrestricted and because of the large numbers involved it has a profound impact of the growth and distribution of population in the States and Territories.

¹ Category jumping relates to those persons who change their travel arrangements from short-term to permanent/long-term or vice versa.

ANALYSES AND COMMENTS *continued*

INTERSTATE MIGRATION *continued*

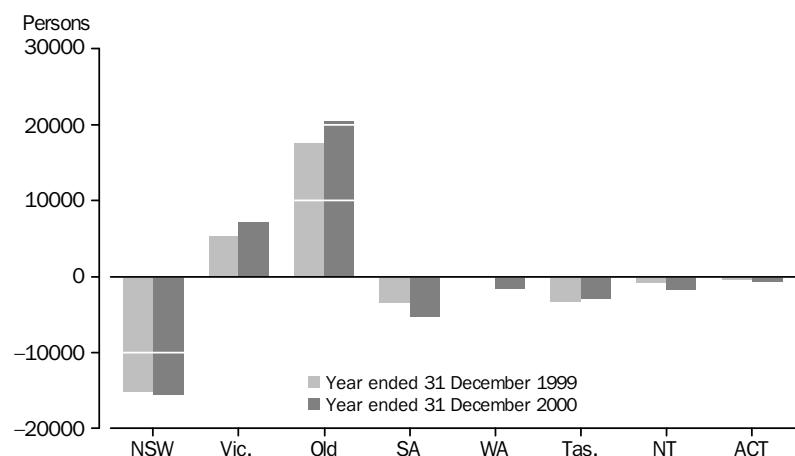

Net interstate migration, States and Territories

With the exception of Queensland and Victoria all States and Territories recorded net interstate migration losses during the year ended December 2000. Queensland gained 20,500 persons and Victoria gained 7,100 persons. Losses recorded were New South Wales 15,600, South Australia 5,200, Western Australia 1,600, Tasmania 2,900, the Northern Territory 1,600 and the Australian Capital Territory 600.

With the exception of the Australian Capital Territory the pattern for December Quarter 2000 was similar to the year ended December 2000 with all States and Territories other than Queensland and Victoria losing population through net interstate migration. The Australian Capital Territory recorded an annual loss (600) for the year ended December 2000 but a gain (100) for the December Quarter 2000.

Net interstate migration levels in the two years ended December 1999 and 2000 show that most States and Territories recording losses increased their loss (New South Wales, South Australia, the Northern Territory and the Australian Capital Territory). While Tasmania also recorded a loss in both years the loss was less in the year ended December 2000 than in the year ended December 1999. Western Australia went from a small gain in the year ended December 1999 to a loss in the year ended December 2000. The States which gained population from net interstate migration, Victoria and Queensland, increased their gain over the same period.

NET INTERSTATE MIGRATION, States and Territories

HOUSEHOLDS AND PEOPLE

There were 7,249,900 households in Australia at June 2000, an increase of 123,400 or 2% since June 1999 and 582,200 or 9% since June 1995. About 25% (1,780,900) of total households were formed by single persons, 31% (2,245,300) by two persons 15 years or over and 4% (282,200) were formed by one person 15 years and over and persons under 15. The proportion of households that were single person households rose by 2 percentage points from June 1995.

At June 2000 the majority of households 70% (5,077,200) had no children under 15 years, 13% (906,600) had one child and another 17% (1,266,100) had two or more children. The proportions at June 1995 were similar, 68%, 13% and 19%, respectively. The resident population of occupied private dwellings at June 2000 was 18.8 million. This equates to an average household size of 2.6 persons per household. At June 1995 the average household size was 2.7 persons.

SPECIAL ARTICLE

INTERSTATE MIGRATION 1999-2000

The movement of people across States and Territories is an important determinant of Australia's population distribution. Historically, mobility in Australia has been high. Of the components of population change at the State and Territory level — births, deaths, net interstate migration and net overseas migration — the net interstate migration has been the most volatile. Interstate migration is unrestricted and, because of the large numbers involved, it has a profound impact on the growth and distribution of population in the States and Territories.

NET INTERSTATE MIGRATION

Queensland and Victoria were the only two States or Territories to have a net gain of persons from interstate migration during 1999–2000. All other States and Territories experienced a net loss. For Western Australia this was the fourth time since 1971–72 that a loss was recorded.

Queensland experienced the largest net interstate inflow of persons of any State or Territory in 1999–2000. Compared with the previous year, Queensland's net interstate migration gain increased 10%. This broke the downward trend that Queensland had been experiencing since its record net inflow during 1992–93 (49,200).

Victoria, for the third year running, experienced a net interstate migration gain. The 1999–2000 inflow was an increase of 69% on the previous year. This is a vast contrast to the previous net interstate losses recorded since 1971–72 which peaked during 1993–94. It is possible that these interstate migrants to Victoria are previous departees from this State who are returning to a more stable economy following the recession of the early 1990s. An October 1999 survey on the mobility of the population in Victoria found that 54% of interstate movers cited employment reasons as their main reason for moving into Victoria, followed by accessibility reasons¹ (31%).

Western Australia's net interstate migration outflow was small. New South Wales (9%) and South Australia (66%) had increased loss of persons due to interstate migration outflow in 1999–2000 compared with 1998–99. All other States and Territories had a net interstate migration outflow, but at a reduced level to the previous year.

¹ Includes 'education', 'be close to family and friends', and 'better lifestyle' responses. Source: ABS, *Population Mobility, Victoria, October 1999* (Cat. no. 3237.2).

NET INTERSTATE MIGRATION
continued

During 1999–2000, 367,400 people are estimated to have moved interstate, 3% more than in the previous financial year, 6% more than ten years ago and 47% more than twenty years ago. This contributed to a population turnover (the sum of interstate arrivals and departures and all permanent and long-term overseas arrivals and departures expressed as a proportion of the resident population)¹ due to interstate migration, of 3.9% for Australia. For the States and Territories the turnover was 3.2% for New South Wales, 2.9% for Victoria, 5.0% for Queensland, 3.9% for South Australia, 3.4% for Western Australia, 5.6% for Tasmania, 17.3% for the Northern Territory and 12.8% for the Australian Capital Territory in 1999–2000.

POPULATION FLOWS

Queensland continued to be the most popular destination for interstate arrivals during 1999–2000 (96,800), followed by New South Wales (93,000), Victoria (71,700) and Western Australia (31,500). New South Wales was the State with the largest number of interstate departures (108,600), followed by Queensland (77,800), Victoria (65,000) and Western Australia (32,200).

The most popular moves were again to or from Queensland, New South Wales and Victoria. The highest interstate flow was from New South Wales to Queensland (50,800 persons), followed by a flow from Queensland to New South Wales (37,300 persons) and from New South Wales to Victoria (25,800 persons). The movement between Queensland and New South Wales resulted in the largest net gain of 13,500 persons to the population of Queensland. The movement between New South Wales and Victoria resulted in the second largest net gain of 2,700 persons to the population of Victoria.

Compared to their population size, the Northern Territory and the Australian Capital Territory experienced large population flows. However, because the inflows are roughly the same as the outflows, their net interstate migration remains small. In the Northern Territory, with an estimated total population of 195,500 at June 2000, there were 16,300 interstate arrivals and 17,100 interstate departures during 1999–2000 resulting in a net interstate migration loss of 870 people. In the Australian Capital Territory, with a population of 310,800 at June 2000, there were 19,400 arrivals and 20,200 departures resulting in a net interstate migration loss of 840 people.

AGE STRUCTURE OF INTERSTATE MIGRANTS

The most mobile people are young adults, aged 25–29 years and the surrounding ages. Of people who moved during 1999–2000, 38% were aged 20–34 years. From the ages of 25–29 years the proportion of people moving interstate decreased as age increased.

In 1999–2000 the median age of all interstate movers was 27.6 years. The Northern Territory (26.0 years) and the Australian Capital Territory (26.2 years) had the youngest median age of interstate arrivals. Tasmania (28.8 years) and Queensland (28.4 years) had the oldest median age of interstate arrivals with 18% and 16%, respectively, of their interstate arrivals over the age of 50. In these two States, as well as in South Australia, the median age of arrivals was higher than the median age of departures.

Tasmania had the lowest median age for interstate departures (26.0), with close to 70% of their departures aged under 35 years. Victoria (28.2 years) and New South Wales (27.9 years) had the oldest median age of interstate departures with 14% and 15%, respectively, of their departures aged over 50.

ADDITIONAL INFORMATION

Further information about interstate migration and overseas migration is available in *Migration, Australia, 1999–2000* (Cat. no. 3412.0) released on 15 March 2001.

¹ Martin Bell, *Internal Migration in Australia 1986–91: Overview report*, AGPS, Canberra, 1995, p120.

SPECIAL ARTICLE

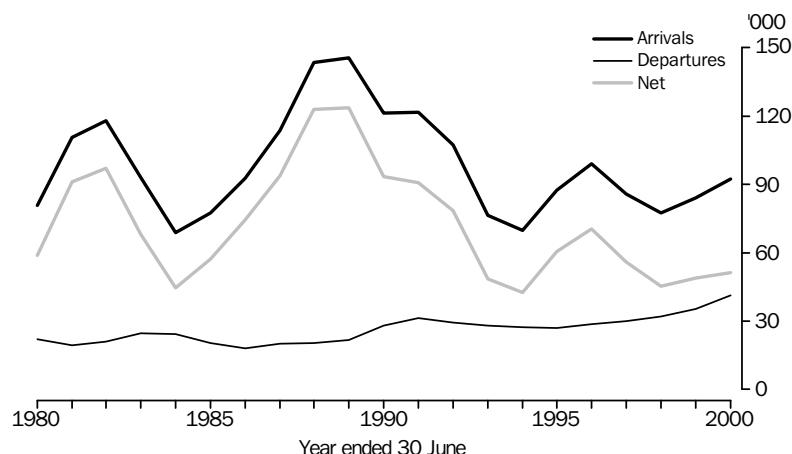

PERMANENT AND LONG-TERM MOVEMENT TO AUSTRALIA

Each year Australia's population increases through net overseas migration (the excess of permanent and long-term arrivals over permanent and long-term departures, with an adjustment for category jumping) and natural increase (the excess of births over deaths). Based on birth and death rates assumed for the future, natural increase is projected to decline over the coming years, with deaths exceeding births somewhere between 2033 and 2046 (*Population Projections, Australia, 1999–2101* (Cat. no. 3222.0)). From that time, net overseas migration gains will become the only source of any continued population growth. In 1999–2000, net overseas migration comprised gains of 51,200 people through net permanent movement and 56,100 people through net long-term movement, and a loss of 8,200 people through category jumping.

PERMANENT MOVEMENT

Until 1999–2000, at least half of Australia's annual net overseas migration gains have stemmed from net permanent movement. Net long-term movement overtook net permanent movement for the first time during 1999–2000. Over the last 20 years Australia has gained, on average, 99,300 permanent settlers each year, ranging from a high of 145,300 in 1989 to a low of 68,800 in 1984. These gains have been partially offset by an average annual loss of 26,400 permanent departures over the same period.

PERMANENT MOVEMENT

In recent years, New Zealand and the United Kingdom have been the major countries of birth for permanent migrants (24% and 10% of all permanent migrants, respectively, in 1999–2000). This reflects both the ease of travel between New Zealand and Australia under the Trans-Tasman Travel Agreement (which does not require immigrants to hold an Australian visa), and the established history of immigration from the United Kingdom to Australia, which has resulted in the United Kingdom-born being the largest overseas-born group in the population (6% of the total population at June 2000).

Permanent migration to Australia is largely regulated by the Government's Migration and Humanitarian Programs (accounting for almost two-thirds of all permanent arrivals during 1999–2000). As a result, Government policy has considerable influence over the number and composition of permanent settlers to Australia each year. Recent government emphasis on the economic benefits of skilled migrants has seen an increase in the proportion of settlers arriving on Skill Migration visas (62% of all Migration Program arrivals in 1999–2000, compared with around 20% during the mid-1980s). This increase is partially attributable to the introduction of a new Skill category in 1997–98 which replaced the Concessional Family category.

PERMANENT MOVEMENT continued Overall, of all settlers in 1999–2000 aged 15 years and over, just over two-thirds (68%) stated an occupation on arrival. Of those who had an occupation, 36% were Professionals, 13% were Tradespersons and related workers, 12% were Managers and administrators and a further 12% were Intermediate production and transport workers. Permanent arrivals tend to have a younger age structure than the population as a whole. In 1999–2000, permanent arrivals had a median age of 28.0 years, compared with a median age of 35.2 years for the total population at June 2000. This is not surprising given the age criteria factored into many of the government's Migration Program visa categories which favour younger migrants.

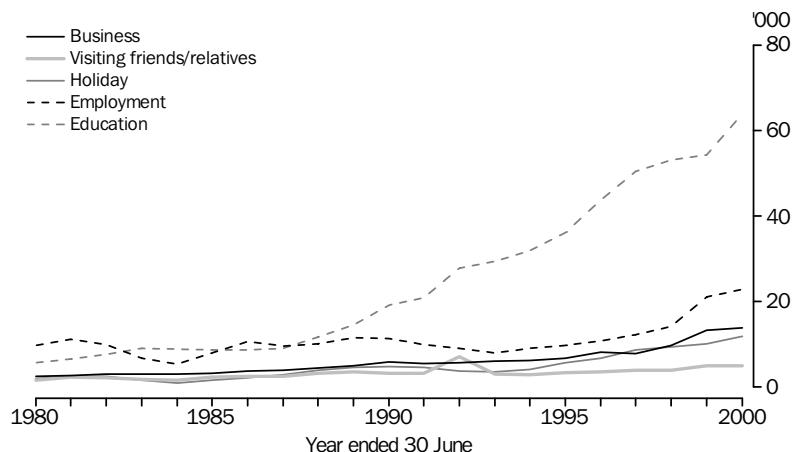

In 1999–2000, there were more female than male settler arrivals, with a sex ratio of 97 males to every 100 females. Settlers were predominantly male in the early 1980s and predominantly female from 1986–87. Over the past 20 years, the sex ratio has ranged from a high of 109 in 1980–81 to a low of 83 in 1995–96.

LONG-TERM VISITOR ARRIVALS

Over the past 20 years, the number of long-term visitor arrivals has increased nearly four-fold, from just 27,300 in 1983–84 to the 1999–2000 high of 133,200. While just over half of all long-term visitor arrivals during 1999–2000 had been born in the three Asian regions, the United Kingdom (14%), Indonesia (6%) and China (6%) were the main individual countries of birth.

Almost half (48%) of all long-term visitor arrivals in 1999–2000 came for education purposes, and a further 28% came for either business or employment reasons. The majority of long-term visitor arrivals from the three Asian regions came for education (75% of all long-term Asian arrivals).

LONG-TERM VISITOR ARRIVALS, Main Reason for Journey

As with permanent arrivals, long-term visitors tended to be younger than the population as a whole (a median age of 24.7 years in 1999–2000). This largely reflects the high number of international students among visitor arrivals, who have the youngest median age of all long-term visitor arrivals (21.8 years).

ADDITIONAL INFORMATION

Additional analysis and data are available in *Migration, Australia, 1999–2000* (Cat. no. 3412.0) released on 15 March 2001.

(a) 1996 Census based. Estimates and the low projections series

assume no change in the propensity to identify as Indigenous, as recorded on 1996 Census forms. The high projection series assume a change in propensity based on the 1991–1996 period.

(b) Includes Jervis Bay Territory.

Period	New South Wales	Victoria	Queensland	South Australia	Western Australia	Tasmania	Northern Territory	Australian Capital Territory(a)	Australia(b)

EXPLANATORY NOTES

INTRODUCTION

1 This quarterly publication contains estimates of the resident populations (ERP) of Australia and the States and Territories based on the final results of the Census of Population and Housing held on 6 August 1996 (with various adjustments described in paragraph 4). The publication also contains estimates of the number of households by household size as well as the latest available statistics of births, deaths (including infant deaths), marriages, divorces and overseas and interstate migration. In addition, the publication includes estimates of the resident population by age, marital status and country of birth as well as experimental estimates of the Aboriginal and Torres Strait Islander population.

2 Following the 1992 amendments to the Acts Interpretation Act to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing from September quarter 1993 include estimates for these two territories. To reflect this change, another category of the State and Territory level has been created, known as Other Territories. Other Territories include Jervis Bay Territory, previously included with the Australian Capital Territory, as well as Christmas Island and the Cocos (Keeling) Islands, previously excluded from population estimates for Australia. Data for Other Territories, while not detailed separately, are included in Australia totals commencing from September quarter 1993.

POPULATION AND COMPONENTS OF POPULATION CHANGE

3 Australia's population estimates for the period since 1971 are compiled according to the place of usual residence of the population. An explanation of the place of usual residence conceptual basis for population estimates is given in *Demographic Estimates and Projections: Concepts, Sources and Methods, Statistical Concepts Library, ABS Website*, <http://www.abs.gov.au>.

METHOD OF ESTIMATION

4 The estimates of the population of Australia and the States and Territories at the date of the Census of Population and Housing are census counts based on place of usual residence adjusted for underenumeration and the number of Australian residents estimated to have been temporarily overseas at the time of the census.

5 Quarterly estimates of the Australian population are obtained by adding to the population at the beginning of each period components of natural increase (on a usual residence basis) and net overseas migration. For the States and Territories, account is also taken of estimated interstate movements involving a change of usual residence. After each census estimates are made for the preceding intercensal period by incorporating an additional quarterly adjustment (intercensal discrepancy) to ensure that the total intercensal increase agrees with the difference between the estimated resident population at the two respective census dates.

NATURAL INCREASE: BIRTHS AND DEATHS

6 In this publication births and deaths data are presented by State and Territory of usual residence. For preliminary estimates, births and deaths by quarter of registration are used as a proxy for quarter of occurrence. For revised estimates a factor has been applied to the number of occurrences to allow for those occurrences which are yet to be registered. For final estimates after 30 June 1991 year/quarter of occurrence data are used. The births and deaths data detailed in the *Components of population* section of this publication are shown by year of occurrence for revised and final data and year/quarter of registration for preliminary data which may affect analysis of relevant tables.

EXPLANATORY NOTES

- NET OVERSEAS MIGRATION **7** Figures are based on net permanent and long-term overseas movements with State and Territory not stated allocated pro rata. Short-term movements are excluded. The estimates from July 1976 onwards include an adjustment for the net effect of category jumping. This adjustment is necessary because net permanent and long-term migration figures can be affected by changes in travel intentions from short-term to permanent/long-term or vice versa. For example, an Australian resident departing for a short-term visit overseas (stating that he/she intends to stay abroad for less than 12 months) in fact stays 12 or more months, thereby changing his/her travel category from short-term to long-term. Prior to December quarter 1989, adjustments for category jumping were only made to revised population estimates. These adjustments are now also included in preliminary estimates. For further details see *Demographic Estimates and Projections: Concepts, Sources and Methods, Statistical Concepts Library, ABS Website*, <http://www.abs.gov.au>.
- NET INTERSTATE MIGRATION **8** Estimates of interstate migration since June 1986 have been derived from latest census data on interstate movement in the preceding one year and unidentified information on interstate changes of address advised to the Health Insurance Commission in the process of administering Medicare.
- RATES OF POPULATION GROWTH **9** These express population change over a period as a proportion (%) of the population at the beginning of the period.
- EXPERIMENTAL ESTIMATES OF ABORIGINAL AND TORRES STRAIT ISLANDER POPULATION **10** Estimates of the Indigenous population are experimental in that the standard approach to population estimation is not possible because satisfactory data on births, deaths and internal migration are not generally available. Furthermore, there is significant intercensal volatility in census counts of the Indigenous population, thus adding to the problem of estimating the true Indigenous population. This volatility can in part be attributed to changes in the propensity of persons to identify as being of Indigenous origin. As a result, a method based on the use of life tables is used to produce time series data. For further details see *Experimental Estimates of the Aboriginal and Torres Strait Islander Population* (Cat. no. 3230.0).
- EXPERIMENTAL PROJECTIONS OF ABORIGINAL AND TORRES STRAIT ISLANDER POPULATION **11** Experimental estimates of the Indigenous population as at 30 June 1996 are used as the base population for projections of the Indigenous population to 30 June 2006. A low and a high projection series have been generated, and respectively imply a low and high overall growth rate of the Indigenous population. The low series uses a nil change in propensity to identify assumption based on the premise that the Indigenous population (as recorded in the 1996 Census) will only change as a result of natural increase. The high series uses a change in propensity to identify assumption based on the increase in the Indigenous population observed between the 1991 and 1996 Censuses which cannot be attributed to natural increase. For further details see *Experimental Projections of the Aboriginal and Torres Strait Islander Population* (Cat. no. 3231.0).
- ESTIMATED RESIDENT HOUSEHOLDS **12** Estimates of households are based on the estimated resident population series, to which propensities to form households are applied. These propensities were estimated from the Census of Population and Housing, and updated using the monthly Labour Force Survey. A detailed description of the method used to produce household estimates is contained in *Household Estimates 1986, 1991–94* (Cat. no. 3229.0).

EXPLANATORY NOTES

MARRIAGES AND DIVORCES **13** All marriage and divorce data are shown by State or Territory of registration. While divorce data are presented by year/quarter of occurrence, marriage data are presented by year/quarter of registration.

14 Divorce data for States and Territories are affected by persons applying to the nearest Family Court rather than the court in their State or Territory of usual residence. The Canberra registry of the Family Court of Australia is particularly affected as it serves, in addition to the Australian Capital Territory, a large area of south-eastern New South Wales and part of Victoria. Around 55% of divorces granted in the Australian Capital Territory are to applicants who are not usual residents of the Territory. The number of divorces granted and the crude divorce rate for the Australian Capital Territory therefore does not accurately reflect the incidence of divorce among Australian Capital Territory residents.

OVERSEAS ARRIVALS AND DEPARTURES ESTIMATION METHOD **15** Overseas arrival and departure statistics are derived from a combination of full enumeration and sampling. All permanent movements and all movements with a duration of stay of one year or more are fully enumerated and processed. All movements with a duration of stay of less than one year are sampled. Statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed.

16 From July 1998 the Department of Immigration and Multicultural Affairs (DIMA) is able to determine the actual length of stay for departing overseas visitors and arriving Australian residents which was previously collected from information on intended length of stay supplied on the arrival or departure card by the passenger. This new method has resulted in a change in data distribution with the number of passengers staying for one year exactly declining significantly.

COUNTRY OF BIRTH **17** The classification of countries in this publication is the Australian Standard Classification of Countries for Social Statistics (ASCCSS). For more detailed information refer to the ABS publication *Australian Standard Classification of Countries for Social Statistics* (Cat. no. 1269.0).

18 Political developments in Europe and the former USSR have resulted in a number of changes to the ASCCSS. These changes have affected some of the categories in this publication and are detailed in Revisions 1.01, 1.02 and 1.03 of the ASCCSS.

19 Overseas migration statistics by country of birth have certain limitations. For instance, it is not possible to separately identify England, Scotland and Wales (United Kingdom).

ROUNDING **20** In this publication population estimates and their components have sometimes been rounded to the nearest hundred. Neither rounded figures nor unrounded figures should be assumed to be accurate to the last digit shown.

21 Where figures have been rounded, discrepancies may occur between sums of component items and totals.

ABS DATA AVAILABLE ON REQUEST

23 As well as the statistics included in this and related publications, the ABS may have other relevant data available on request. Inquiries should be made to the National Information Service on 1300 135 070.

24 Current publications produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (Cat. no. 1101.0). The ABS also issues, on Tuesdays and Fridays, a *Release Advice* (Cat. no. 1105.0) which lists publications to be released in the next few days. Both are available from any ABS office.

25 Statistics of overseas arrivals and departures and related data are also published regularly by the Department of Immigration and Multicultural Affairs (see that Department's quarterly publication, *Immigration Update*) and by the Bureau of Tourism Research (on international travel and tourism).

G L O S S A R Y

Age-specific fertility rates	Age-specific fertility rates are the number of live births (occurred or registered) during the calendar year, according to age of mother, per 1,000 of the female estimated resident population of the same age at 30 June. For calculating these rates, births to mothers under 15 are included in the 15–19 age group, and births to mothers aged 50 and over are included in the 45–49 age group. Pro rata adjustment is made in respect of births for which age of mother is not given.
Average household size	Average household size refers to the number of persons per household in private dwellings.
Birth	The delivery of a child, irrespective of the duration of pregnancy, who, after being born, breathes or shows any other evidence of life such as heartbeat.
Category jumping	Category jumping is the term used to describe changes between intended and actual duration of stay of travellers to/from Australia, such that their classification as short-term or as long-term/permanent movers is different at arrival/departure from that after 12 months. Category jumping consists of two components—an Australian resident component and an overseas visitor component. The Australian resident component of category jumping for a reference quarter is estimated by comparing the number of residents departing short-term in that quarter with all residents who left in that quarter and return in the following 12 months, to obtain the net number of Australian residents who jump category. Similarly, the number of overseas visitors arriving short-term in a quarter is compared with all overseas visitors and permanent arrivals who arrived in that quarter and depart in the following 12 months, to obtain the net number of overseas visitors who jump category. Estimates of category jumping are derived by subtracting the Australian resident component from the overseas visitor component.
Category of movement	Overseas arrivals and departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main categories of movement: <ul style="list-style-type: none">▪ permanent movements;▪ long-term movements (one year or more); and▪ short-term movements (less than one year). A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly, in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Crude divorce rate	The crude divorce rate is the number of decrees absolute granted during the financial year, per 1,000 estimated resident population at 31 December. In the interpretation of this rate, it must be kept in mind that a large and varying proportion of the population used in the denominator is unmarried or is below the minimum age of marriage.

G L O S S A R Y

Crude marriage rate	The crude marriage rate is the number of marriages registered during the financial year, per 1,000 estimated resident population at 31 December. In the interpretation of this rate, it must be kept in mind that a large and varying proportion of the population used in the denominator is below the minimum age of marriage or is already married.
Divorce	Decrees absolute of dissolution of marriage.
Estimated resident population (ERP)	<p>The concept of estimated resident population (ERP) links people to a place of usual residence within Australia. Usual residence is that place where each person has lived or intends to live for six months or more in a reference year.</p> <p>The ERP is an estimate of the Australian population obtained by adding to the estimated population at the beginning of each period the components of natural increase (on a usual residence basis) and net overseas migration. For the States and Territories, account is also taken of estimated interstate movements involving a change of usual residence.</p> <p>Estimates of the resident population are based on census counts by place of usual residence, to which are added the estimated net census undercount and Australian residents estimated to have been temporarily overseas at the time of the Census. Overseas visitors in Australia are excluded from this calculation.</p> <p>After each census, estimates for the preceding intercensal period are revised by incorporating an additional adjustment (intercensal discrepancy) to ensure that the total intercensal increase agrees with the difference between the ERPs at the two respective census dates.</p>
Former Yugoslav Republics	Consists of Bosnia-Herzegovina, Croatia, the former Yugoslav Republic of Macedonia, Slovenia, the former Yugoslav Republics of Serbia and Montenegro, and Yugoslavia n.f.d.
Household	<p>A household is a group of two or more related or unrelated people who usually reside in the same dwelling, who regard themselves as a household and who make common provision for food or other essentials for living; or a person living in a dwelling who makes provision for his or her own food and other essentials for living, without combining with any other person. Households include group households of unrelated persons, same-sex couple households, single-parent households as well as one-person households.</p> <p>A household usually resides in a private dwelling (including caravans etc. in caravan parks). Persons usually resident in non-private dwellings, such as hotels, motels, boarding houses, jails and hospitals, are not included in household estimates.</p> <p>This definition of a household is consistent with the definition used in the Census. The number of households can be either based on count or estimated resident population.</p>
Household estimate	Household estimate is a measure of the number of households of the usually resident population. It is based on the census count of households which is adjusted for missed households, households of overseas visitors, households of Australian residents where all members were temporarily overseas at the time of the Census and households of Australian residents where all members were not home on census night and spent census night in a non-private dwelling in Australia.

G L O S S A R Y

Household population	The household population is the estimated resident population (ERP) that usually lives in private dwellings. It is the ERP less the population that usually lives in non-private dwellings.
Household size	Household size refers to the number of persons in a household.
Infant mortality rate	The number of deaths of children under one year of age in a financial year per 1,000 live births in the same financial year.
Intercensal discrepancy	Intercensal discrepancy is the difference between two estimates of a census year population, the first based on the latest census and the second arrived at by updating the previous census date estimate with intercensal components of population change which take account of information available from the latest census. It is caused by errors in the start and/or finish population estimates and/or in estimates of births, deaths or migration in the intervening period which cannot be attributed to a particular source.
Long-term arrivals	Long-term arrivals comprise: <ul style="list-style-type: none">▪ overseas visitors who intend to stay in Australia for 12 months or more (but not permanently); and▪ Australian residents returning after an absence of 12 months or more overseas.
Long-term departures	Long-term departures comprise: <ul style="list-style-type: none">▪ Australian residents who intend to stay abroad for 12 months or more (but not permanently); and▪ overseas visitors departing who stayed 12 months or more in Australia.
Marital status	Two separate concepts are measured by the Australian Bureau of Statistics. These are registered marital status and social marital status. They have different personal characteristics and are independent variables with separate classifications. Marital status relates to registered marital status which refers to formally registered marriages or divorces for which the partners hold a certificate. Four categories of marital status are identified: never married, married, widowed and divorced.
Marriage	Refers to registered marriages only. Under the <i>Australian Marriage Act 1961</i> (Cwlth), a marriage may be celebrated by a minister of religion registered as an authorised celebrant, by a district registrar or by other persons authorised by the Attorney-General. Notice of the intended marriage must be given to the celebrant at least one calendar month but within six calendar months before the marriage. A celebrant must transmit an official certificate of the marriage for registration in the State or Territory in which the marriage took place.
Natural increase	Excess of births over deaths.
Net interstate migration	The difference between the number of persons who have changed their place of usual residence by moving into a given State or Territory and the number who have changed their place of usual residence by moving out of that State or Territory. This difference may be either positive or negative.
Net overseas migration	Net overseas migration is net permanent and long-term overseas migration plus an adjustment for the net effect of category jumping.

G L O S S A R Y

Net permanent and long-term movement	The difference between the number of permanent (settler) and long-term arrivals and the number of permanent and long-term departures. Short-term movements are excluded.
Overseas arrivals and departures (OAD)	Overseas arrivals and departures (OAD) refer to the arrival or departure of persons, through Australian airports (or sea ports), which have been recorded. Statistics on OAD relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).
Permanent arrivals (settlers)	Permanent arrivals (settlers) comprise: <ul style="list-style-type: none">▪ travellers who hold migrant visas (regardless of stated intended period of stay);▪ New Zealand citizens who indicate an intention to settle; and▪ those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens).
	This definition of settlers is used by the Department of Immigration and Multicultural Affairs (DIMA). Prior to 1985 the definition of settlers used by the Australian Bureau of Statistics (ABS) was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and the DIMA.
Permanent departures	Permanent departures are Australian residents (including former settlers) who on departure state that they are departing permanently.
Population growth	For Australia, population growth is the sum of natural increase and net overseas migration. For States and Territories, population growth also includes net interstate migration. After the Census, intercensal population growth also includes an allowance for intercensal discrepancy.
Short-term arrivals	Short-term arrivals comprise: <ul style="list-style-type: none">▪ overseas visitors who intend to stay in Australia for less than 12 months; and▪ Australian residents returning after a stay of less than 12 months overseas.
Short-term departures	Short-term departures comprise: <ul style="list-style-type: none">▪ Australian residents who intend to stay abroad for less than 12 months; and▪ overseas visitors departing after a stay of less than 12 months in Australia.

G L O S S A R Y

Standardised death rate	Standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The ABS standard populations relate to the years ending in 1 (eg 1991). The current standard population is all persons in the 1991 Australian population. They are expressed per 1,000 or 100,000 persons. There are two methods of calculating standardised death rates: <ul style="list-style-type: none">▪ The <i>direct method</i>—this is used when the populations under study are large and the age-specific death rates are reliable. It is the overall death rate that would have prevailed in the standard population if it had experienced at each age the death rates of the population under study.▪ The <i>indirect method</i>—this is used when the populations under study are small and the age-specific death rates are unreliable or not known. It is an adjustment to the crude death rate of the standard population to account for the variation between the actual number of deaths in the population under study and the number of deaths which would have occurred if the population under study had experienced the age-specific death rates of the standard population.
	Wherever used, the definition adopted is indicated.
State or Territory of registration	State or Territory of registration refers to the State or Territory where the marriage was registered or the divorce was granted.
State or Territory and Statistical Local Area (SLA) of usual residence	State or Territory and Statistical Local Area (SLA) of usual residence refers to the State or Territory and SLA of usual residence of: <ul style="list-style-type: none">▪ the population (estimated resident population);▪ the mother (birth collection); or▪ the deceased (death collection).
	In the case of overseas movements, State or Territory of usual residence refers to the State or Territory regarded by the traveller as the one in which he/she lives or has lived. State or Territory of intended residence is derived from the intended address given by settlers, and by Australian residents returning after a journey abroad. Particularly in the case of the former, this information does not necessarily relate to the State or Territory in which the traveller will eventually establish a permanent residence.
Total fertility rate	The sum of age-specific fertility rates (live births at each age of mother per female population of that age). It represents the number of children a woman would bear during her lifetime if she experienced current age-specific fertility rates at each age of her reproductive life.
