KEY POINTS

- Preliminary estimates indicate that there were 389,500 short-term visitor arrivals to Australia during January 2003.
- The trend estimate for short-term visitor arrivals in January 2003 was 409,100, remaining relatively unchanged from the previous month.
- The trend estimate for short-term visitor arrivals has been slowly increasing in most months since December 2001 and was now 25,100 higher (7%).
- The total number of short-term visitor arrivals for the seven months to January 2003 amounted to 2,938,000, an increase of 2.9% compared to the seven months to January 2002 (2,854,900).
- During December 2002 there were 365,100 short-term departures of Australian residents, bringing the total to 3,461,000 in 2002.
- In 2002 there were 89,300 permanent arrivals and 49,100 permanent departures.
- The net gain from permanent and long-term migration during 2002 was 139,100 people, remaining relatively unchanged from the previous year (132,000 people).
- For further information about these and related statistics, contact the National Information and Referral Service on 1300 135 070, or Rachael Hill on Canberra 02 6252 5640.

.

SHORT-TERM MOVEMENTS

VISITOR ARRIVALS	
	There were 534,000 short-term visitor arrivals to Australia during December 2002. This
	brought the total for the year ended December 2002 to 4,841,200, remaining relatively unchanged from the previous year.
	In the last three months of 2002, there were 25,600 short-term visitor arrivals from Indonesia, a decrease of 18% compared to the corresponding period in 2001 (31,100). There was also a 13% decrease of short-term visitor arrivals from Phillipines. The decreases were compensated by increases in short-term visitor arrivals from Malaysia (15%), Thailand (4%) and Singapore (2%). In the quarter ended December 2002 short-term visitor arrivals were up by 1% from all Southeast Asian countries. For more information see the special article on page 4.
MAIN STATE OF STAY	
	During 2002, 42% of all short-term overseas visitors to Australia stated, at their time of
	departure, that they had spent most of their time in New South Wales. A further 28% had
	spent most of their time in Queensland, 16% in Victoria and 9% in Western Australia.
RESIDENT DEPARTURES	
	During December 2002 there were 365,100 short-term departures of Australian
	residents, bringing the yearly total to 3,461,000, little more than the 2001 total. The main
	destinations for Australian residents departing short-term during the year 2002 were New
	Zealand (17% of all short-term resident departures), the United Kingdom and the United
	States of America (each 9%) and Indonesia (7%)
	Australians departing for Southeast Asian countries during December quarter 2002:
	45,100 Australian residents mainly visited Thailand, an increase of 8% compared to the corresponding period in 2001;
	37,300 Australian residents mainly visited Indonesia, a decrease of 37%;
	33,400 Australian residents mainly visited Singapore, a decrease of 17%;
	28,700 Australian residents mainly visited Malaysia, an increase of 8%;
	18,200 Australian residents mainly visited Phillipines, an increase of 5%;

PERMANENT AND LONG-TERM MOVEMENTS

There were 7,200 permanent (settler) arrivals in Australia during December 2002. This brought the total for 2002 to 89,300 (a decrease of 11% compared to the corresponding period in 2001). New Zealand was the main source country for settler arrivals in 2002, accounting for 16% of all permanent arrivals. The United Kingdom was the second largest source country for settlers, accounting for 11% of all permanent arrivals.

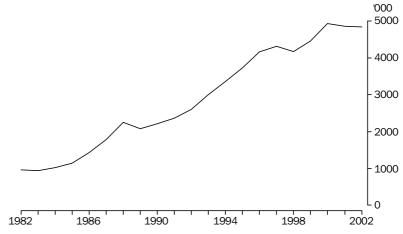

During December 2002 there were 4,500 permanent departures from Australia. This brought the total number of permanent departures to 49,100 in 2002. This was 3% higher than in 2001.

The net gain from permanent and long-term movement during 2002 was 139,100 people, remaining relatively unchanged from the previous year (140,300 people).

SHORT - TERM VISITOR ARRIVALS IN 2002 - YEAR IN REVIEW

In 2002 there were 4,841,200 short-term visitor arrivals to Australia, a small decrease compared to 2001 (4,855,700). This is the second year in which a small decline in short-term arrivals was recorded. However, the time series was affected by events such as the Sydney Olympic and Paralympic Games in 2000, and the terrorist attacks in the United States of America on September 11, 2001. Over the past 20 years, short-term arrivals have increased five-fold.

SHORT TERM VISITOR ARRIVALS, 1982-2002

The main countries of residence of short-term visitor arrivals to Australia in 2002 were New Zealand (16%) and Japan (15%). The United Kingdom (13%) was the third main source country followed by the United States of America (9%) and Singapore (6%). These five main source countries were also the top five source countries in 2001, and together accounted for 59% of total visitor arrivals in 2002.

Holiday was given as the main reason for travel for half (50%) of all short-term visitor arrivals to Australia in 2002, followed by visiting friends and relatives (18%), and business (9%). Among visitors from the top five source countries, holidays in Australia were particularly popular among those from Japan (70%), while those from the United Kingdom (31%) were most likely to be visiting friends and relatives. Business travel was most common for visitors from the United States of America (16%) and New Zealand (15%). Short-term visitor arrivals travelling for employment has increased by 44% between 2001 and 2002, compared to an increase of 13% between 2000 and 2001.

SHORT - TERM VISITOR ARRIVALS IN 2002 - YEAR IN REVIEW

The median duration of stay for short-term visitor arrivals to Australia in 2002 was 11 days. Those visiting friends and relatives stayed for a median duration of 18 days, while holiday-makers and business travellers stayed for a median duration of 10 days and 8 days respectively. Japanese visitors tended to stay in Australia for the shortest period of time (median of 7 days) while, among visitors from the top five source countries, those from the United Kingdom stayed the longest (median of 22 days).

Just over half (52%) of all short-term visitor arrivals to Australia in 2002 were male. The median age of all male visitors was 39 years while the median age of all female visitors was 36 years. Short-term business travellers were mostly male (82%), while more than half (53%) of all short-term holiday-makers were female. Males travelling for business or for holidays tended to be older (with a median age of 42 years and 37 years respectively) than females travelling for the same reasons (median ages of 38 years and 35 years respectively). Females visiting friends or relatives tended to be older (median age of 45 years) than males visiting friends or relatives (median age of 43 years). Among short-term visitor arrivals from the top five source countries, those from New Zealand had the highest median age (42 years), while Japanese visitors had the lowest median age (32 years).

Most short-term visitor arrivals to Australia in 2002 stated their intentions to stay mainly in New South Wales (40%), Queensland (28%) or Victoria (17%). Visitors arriving mainly for business or to visit friends or relatives provided an exception to this, intending to stay mainly in New South Wales (47% and 40% respectively), followed by Victoria (25% and 22%) and Queensland (14% and 19%).

Short-term visitor arrivals from New Zealand intended to stay mainly in Queensland (37%) or New South Wales (36%), while Japanese visitors were considerably more likely to stay in Queensland (58%). Visitors from the United Kingdom (44%) and the United States (53%) were more likely to stay in New South Wales than in any other state, while visitors from Singapore were equally likely to stay in New South Wales and Western Australia (each 26%).

INTRODUCTION	1 This publication contains statistics of persons arriving in, and departing from, Australia, together with the major characteristics of travellers. More detailed statistics can be made available on request (see paragraph 23).
SOURCE OF THE STATISTICS	2 Persons arriving in, or departing from, Australia provide information in the form of incoming and outgoing passenger cards (see Appendix 1). Incoming persons also provide information in visa applications, apart from people travelling as Australian and New Zealand citizens. These and other information available to the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA) serve as a source for statistics of overseas arrivals and departures.
	3 In July 1998, DIMIA revised the incoming and outgoing passenger cards and associated procedures as well as computer systems. Following these changes, some questions on the passenger cards were not compulsory and answers to these questions were not checked by Customs officers. The question on marital status was deleted. Data on marital status is now derived from visa applications (only for certain visa classes) and is therefore not available for Australian or New Zealand citizens. The changes also affect the data for 'previous country of residence' which is imputed for Australian and New Zealand citizens. For more information see the May 1998 issue of this publication. Since July 1998, there have been additional minor changes to both passenger cards.
	 4 From July 2001, DIMIA adopted a new passenger card processing system which involved electronic imaging of passenger cards and intelligent character recognition of the data stored in the images. This process has yielded several improvements to the processing of passenger card data, most notably the detailed information about missing values. There have also been several changes to data quality. Information on these changes appears in Appendix 2. 5 The preliminary estimates of visitor arrivals by country of residence (see table 6, page 9) are based on data from DIMIA's Travel and Immigration Processing System (TRIPS). The TRIPS system produces a limited range of data, including country of citizenship, which is used by ABS to produce preliminary estimates by country of usual residence. These preliminary estimates will be revised in the next issue of this publication, when final data is available. For more information see pages 3 and 4 of the June 1997 and the September 1998 issues of this publication.
SCOPE	6 The statistics in this publication relate to the number of movements of travellers rather than the number of travellers (i.e. multiple movements of individual persons during a given reference period are each counted separately). The statistics exclude the movements of operational air and ships' crew, of transit passengers who pass through Australia but are not cleared for entry, and of passengers on pleasure cruises commencing and finishing in Australia aboard ships not then engaged on regular voyages. Similarly, these

statistics exclude those persons not travelling under standard visa conditions,

such as 'boat people' and the 1999 intake of Kosovo refugees.

COUNTRY CLASSIFICATION	7 The classification of countries in this publication is the Australian Standard Classification of Countries for Social Statistics (ASCCSS). For more detailed information refer to the ABS publication <i>Australian Standard Classification of Countries for Social Statistics</i> (cat. no. 1269.0).
	8 The statistics on country of birth, citizenship, residence or main destination have certain limitations because of reporting on passenger cards. For instance, United Kingdom includes England, Scotland and Wales. Similarly Korea includes both the Republic of Korea and the Democratic People's Republic of Korea.
STATE AND TERRITORY CLASSIFICATION	9 Following the 1992 amendment to the <i>Acts Interpretation Act</i> to include the Indian Ocean Territories of Christmas Island and the Cocos (Keeling) Islands as part of geographic Australia, population estimates commencing with the September quarter 1993 include estimates for these two territories. To reflect this change, another category of the state/territory classification has been created, known as Other Territories. Other Territories includes Jervis Bay Territory, Christmas Island and the Cocos (Keeling) Islands.
ESTIMATION METHOD	10 Overseas arrival and departure statistics are derived from a combination of full enumeration and sampling. All permanent movements and all movements with a duration of stay of one year or more are fully enumerated. All movements with a duration of stay of less than one year are sampled. Statistics relating to these movements are therefore estimates which may differ from statistics which would have been obtained if details of all these movements had been processed.
	11 Since January 1997 variable sample skips have been used in the selection of records to be sampled. Separate skips are applied for each country of citizenship and the skips may vary for each processing month. Over a year about 3.5% of all short term movements are selected for sampling.
	12 The statistics in this publication have been rounded to the nearest 100 for short-term movements and to the nearest 10 for permanent and long-term movements. The sums of the components may, due to rounding, not add exactly to totals.
CORRECTIONS AND IMPUTATIONS	13 The imprecision due to sampling errors should not be confused with errors arising from imperfections in reporting, which may occur in any data collection, whether sampled or not. Every effort is made to minimise such errors, both through careful design of the passenger cards and through checks on the information once it is received. During the edit process some items are corrected where they conflict with other known information. Missing replies to certain items such as age and country of birth are also imputed by reference to other related items. Information on non-response rates and data imputation appears in Appendix 2.
	14 Errors of this kind differ from discrepancies arising from the fact that certain information reflects the travellers' intentions at the time the passenger cards were completed. These intentions are, of course, subject to change. Particularly affected is the distinction between permanent and temporary movement and in the latter case, length of intended stay, country in which most time will be spent and main reason for journey.

SEASONAL ADJUSTMENT AND TREND ESTIMATES

RELATED PUBLICATIONS

15 Original and seasonally adjusted short-term overseas visitor arrivals and short-term Australian resident departures are shown in tables 1 and 2 respectively. In the seasonally adjusted series, account has been taken of normal seasonal factors and trading day effects (arising from the varying numbers of Sundays, Mondays, Tuesdays etc. in the month) and the effect of movement in the date of Easter which may, in successive years, affect figures for different months.

16 Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series may be more clearly recognised. Seasonal adjustment procedures do not aim to remove the irregular or non-seasonal influences which may be present in any particular month, such as the effect of major sporting and cultural events, changes in airfares and the fluctuation of the Australian dollar relative to other currencies. Irregular influences that are highly volatile can make it difficult to interpret the movement of the series even after adjustment for seasonal variation.

17 The trend estimates for short-term overseas visitor arrivals and short-term Australian resident departures are shown in tables 1 and 2 respectively. These trend estimates are derived by applying a 13–term Henderson-weighted moving average to all months of the respective seasonally adjusted series except the first and last six months. Trend series are created for the last six months by applying surrogates of the Henderson weighted moving average to the seasonally adjusted series.

18 While this technique enables smoothed data for the latest period to be produced, it does result in revisions to the smoothed series, principally of recent months, as additional observations become available. There may also be revisions as a result of the re-estimation of the seasonal factors. For further information, see *A Guide to Interpreting Time Series—Monitoring 'Trends', an Overview* (cat. no. 1348.0).

19 Due to the non-sequential processing of data in 2000–2002, final seasonally adjusted and trend estimates for short-term Australian resident departures are not yet available and have therefore not been included in Table 2 in this issue. These estimates will be made available in a forthcoming issue.

20 Users of these statistics may also wish to refer to the following ABS publications:

- Australian Demographic Statistics (cat. no. 3101.0)—issued quarterly
- Migration, Australia (cat. no. 3412.0)—issued annually
- Tourism Indicators, Australia (cat. no. 8634.0)—issued quarterly.

21 Related statistics are also published by the Department of Immigration and Multicultural and Indigenous Affairs, the Department of Transport and Regional Services and the Bureau of Tourism Research.

22 Current publications and other products produced by the ABS are listed in the *Catalogue of Publications and Products, Australia* (cat. no. 1101.0). The Catalogue is available from any ABS office or the ABS web site <www.abs.gov.au>. The ABS also issues a daily *Release Advice* on the web site which details the products to be released in the week ahead.

.

ADDITIONAL STATISTICS AVAILABLE	23 As well as the statistics included in this and related publications, other relevant unpublished data are available for the following variables:

GLOSSARY

.

Australian resident	Australian residence is self-defined as reported by travellers when completing Incoming and Outgoing Passenger Cards.
Category of movement	Overseas Arrivals and Departures are classified according to length of stay (in Australia or overseas), recorded in months and days by travellers on passenger cards. There are three main <i>categories of movement</i> :
	permanent movementslong-term movementsshort-term movements.
	A significant number of travellers (i.e. overseas visitors to Australia on arrival and Australian residents going abroad) state exactly 12 months or one year as their intended period of stay. Many of them stay for less than that period and on their departure from, or return to, Australia are therefore classified as short-term. Accordingly in an attempt to maintain consistency between arrivals and departures, movements of travellers who report their actual or intended period of stay as being one year exactly are randomly allocated to long-term or short-term, in proportion to the number of movements of travellers who report their actual length of stay as up to one month more, or one month less, than one year.
Country of residence	Country of residence refers to the country in which travellers regard themselves as living or as last having lived.
Intended length of stay	On arrival in Australia, all overseas visitors are asked to state their 'Intended length of stay in Australia'. On departure from Australia, all Australian residents are asked to state their 'Intended length of stay abroad'.
Long-term arrivals	Long-term arrivals comprise:
	 overseas visitors who intend to stay in Australia for 12 months or more (but not permanently); and Australian residents returning after an absence of 12 months or more overseas.
Long-term departures	Long-term departures comprise:
	 Australian residents who intend to stay abroad for 12 months or more (but not permanently); and overseas visitors departing who stayed 12 months or more in Australia.
Main destination	Australian residents travelling overseas are asked on departure for the name of the country in which they intend to spend most time.

GLOSSARY

• • • • • • • • • • • • • • • • • • •

Main reason for journey	On arrival in, or departure from, Australia all overseas visitors and Australian residents are asked to state their purpose of journey. From September 1994, all statistics relating to <i>main reason for journey</i> have been published using the following categories:
	 convention/conference business visiting friends/relatives holiday employment education other
	In tabulations of data collected before September 1994, the 'Other' category includes 'In transit' and the 'Holiday' category includes both 'Student vacation' and 'Accompanying business visitor'.
Main state/territory of stay	Overseas visitors are asked on departure for the name of the state or territory in which they spent the most time.
Overseas Arrivals and Departures (OAD)	Overseas Arrivals and Departures refer to the arrival or departure of Australian residents or overseas visitors, through Australian airports (or sea ports), which have been recorded on Incoming or Outgoing Passenger Cards. Statistics on Overseas Arrivals and Departures relate to the number of movements of travellers rather than the number of travellers (i.e. the multiple movements of individual persons during a given reference period are all counted).
Permanent arrivals	Permanent arrivals (settlers) comprise:
	 travellers who hold migrant visas (regardless of stated intended period of stay); New Zealand citizens who indicate an intention to settle; and those who are otherwise eligible to settle (e.g. overseas born children of Australian citizens).
	This definition of settlers is used by the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA). Prior to 1985 the definition of settlers used by the ABS was the stated intention of the traveller only. Numerically the effect of the change in definition is insignificant. The change was made to avoid the confusion caused by minor differences between data on settlers published separately by the ABS and DIMIA.
Permanent departures	Permanent departures are Australian residents (including former settlers) who on departure state that they intend to settle permanently in another country.
Short-term arrivals	Short-term arrivals comprise:
	 overseas visitors whose intended stay in Australia is less than 12 months; and Australian residents returning after an absence of less than 12 months overseas.
Short-term departure	Short-term departures comprise:
	 Australian residents who intend to stay abroad for less than 12 months; and overseas visitors departing who stayed less than 12 months in Australia.

STANDARD ERRORS

RELIABILITY OF ESTIMATES

1 Estimates based on a sample are subject to sampling variability i.e. they may differ from those that would be obtained from full enumeration.

2 The sampling error associated with any estimate can be estimated from the sample results and one measure so derived is the standard error. Given an estimate and the standard error on that estimate, there are about two chances in three that the sample estimate will differ by less than one standard error from the figure that would have been obtained from full enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors. The relative standard error is the standard error on the estimate expressed as a percentage of the estimate.

3 It would be impractical to publish estimates of standard errors for all figures in individual tables. However, the following table of standard errors and relative standard errors gives an indication of the magnitude of the sampling error associated with any estimate of a particular size for short-term and total movement.

		RM E OR ARRIVAL ALIAN RESIDENTS	· · · · · · · · · · -	OR DEPARTURE	TOTAL ARRIVALS DEPARTUR	•••

300	110	36	84	28	97	32
200	90	45	70	35	80	40
100	63	63	49	49	56	56

APPROXIMATE STANDARD ERRORS ON ESTIMATES FOR STRATIFIED SAMPLE

4 An example of the use of this table is as follows. If the estimate of the number of Australian resident departures for short-term visits abroad is 500, then the standard error on this estimate is 130 i.e. there are two chances in three that the actual number of Australian resident departures for short-term visits abroad will lie between 370 and 630 and nineteen chances in twenty that it will lie between 240 and 760.

5 The larger the size of an estimate the smaller the relative standard error. For any estimate of greater than 10,000 the relative standard error will be less than 6%.

6 The estimate of the difference between an estimate in two different periods or between different estimates from the same period is also subject to sampling error. The standard error on the difference between any two estimates which are subject to sampling error can be approximated by using the larger standard error of the estimates inflated by a factor of 1.4.

7 An example of the use of this procedure is as follows. Assume the estimates of the number of arrivals to Australia from Taiwan during January 1994 and January 1995 are 1,500 and 750 respectively. The difference between the 1994 and 1995 figures is 750 and the standard errors on these estimates are approximately 190 and 140. The standard error on the difference is approximately 266 (1.4×190), and there are nineteen chances in twenty that the estimate of the difference between the two years will lie between 218 and 1,282.

(a) Incoming card used from November 1999. Outgoing card used from July 2000 when a new question on currency was added to the reverse side. See paragraph 3 of the Explanatory Notes for information on passenger card changes.

. . . .

SCANNING AND IMAGING	The introduction of a new passenger card processing system from July 2001 has meant that information is now available on the frequency and impact of data item imputation. Much of this information has not been available previously. Additionally, the move to a new processing system has also given rise to new data quality issues directly associated with scanning and imaging.
DEFECTIVE CARDS	There are a small number of unreadable or damaged passenger cards for each month. ABS receives the count of these cards from the Department of Immigration and Multicultural and Indigenous Affairs (DIMIA) by movement direction, box type and port of clearance. The information on these cards is then physically processed by the ABS and included in the estimates presented here.
DURATION OF STAY	From July 1998 DIMIA are able to determine the actual length of stay for departing overseas visitors and arriving Australian residents which was previously collected from information on intended length of stay supplied on the arrival and departure card by the passenger. This new method had resulted in a change in data distribution with the number of passengers staying for one year exactly declining significantly when compared with movements prior to July 1998.
	The introduction of the new passenger card processing system from July 2001 has shown further evidence of rounding to exactly one year in intended duration of stay/travel as reported by visitors arriving in Australia and Australian residents departing the country. To reflect the historical movement patterns, the records with a reported duration of exactly one year are allocated to short-term and long-term. For visitors, 75% of such records are allocated to short-term and 25% to long-term. The ratio is 67:33 for residents departing Australia.
TRIPS AND MATCHING OF MOVEMENTS ON THE SECOND LEG OF TRAVEL	Each month there are records for long-term residents returning to Australia and long-term visitors departing Australia which could not be matched with DIMIA's Travel and Immigration Processing System (TRIPS) records. Records have been created directly from TRIPS for records that did not match with a passenger card and then added to the ABS processing system.
NEW ZEALAND CITIZENS	Travellers on New Zealand (NZ) passports do not need a visa to enter Australia. As a result, on arrival in Australia their visa documentation cannot be used to determine whether they are either a permanent migrant or a temporary visitor, or an Australian resident returning from New Zealand. DIMIA believes that a substantial proportion of holders of NZ passports tick Box A (migrating to Australia) each time they arrive in the country, causing an overcount of NZ migrants entering Australia. To correct the overcounting of NZ migrants, with the introduction of the new processing system from July 2001, DIMIA coded all NZ citizen arrivals who had ticked Box A and had been to Australia previously (based on immigration records) to resident returning (Box C). If these people were visitors previously, this recoding had the effect of incorrectly reducing the number of NZ migrants whilst at the same time incorrectly increasing the number of NZ citizen returning residents. This problem was overcome by moving the NZ citizens that have been changed by DIMIA from Box A to Box C back to Box A. DIMIA are currently investigating methods to allocate NZ citizens to the correct category of travel.

(a) Non-response rates are unweighted.(b) Not available for Australian or New Zealand citizens.

(c) Not available for short-term movements.

INTENDED LENGTH OF STAY / TIME AWAY FROM AUSTRALIA

prevented reliable estimation of non-response rates for these two data items.

MAIN REASON FOR JOURNEY

Before the introduction of the redesigned passenger card in July 1998, 5% of short-term visitor arrivals, on average, were recorded as having a reason for journey of 'Other' or 'Not Stated'. This percentage rose to 14% for July, 16% in August and 29% in September 1998 as a result of processing problems. These problems have now been addressed by DIMIA, with the percentage of 'Other' and 'Not Stated' dropping in October 1998 to 8% and 7% in November 1998.

Non-response rates are available for these data items from November 1998. For data

prior to November 1998, imputation carried out as part of processing by DIMIA has

From the January 1999 issue of this publication, published figures (table 3 in this publication) referencing these three months have been revised. The revised data were calculated by estimating the number of persons responding 'Other / Not Stated' using past trends for each country of citizenship and proportionally allocating any persons in excess of the estimated 'Other / Not Stated' total amongst the remaining categories. 'Not Stated' rates are now separately available from February 1999 onwards.

STATE IN WHICH MOST TIME WAS SPENT	experienced by DIMIA caused a state of stay with a correspondi territories. These numbers have	September 1998 and October 1998, data entry problems n overstatement of the Northern Territory as the main ng understatement for the remaining states and e returned in November 1998 to levels more comparable a indicating that they have instigated data quality e.

	stages. In the first stage, record	s with country of stay/residence missing were set to
		adaptions if a second process and italian. The the second states

stages. In the first stage, records with country of stay/residence missing were set to country of disembarkation/embarkation if a response was available. In the second stage, for remaining records where country of stay/residence was missing, values were imputed at the category of traveller, reason for journey and country of citizenship level based on responses to other cards within each subgroup. Accordingly, the level of records with data for country of stay/residence not stated has been minimised.

SEPTEMBER 1999 PROCESSING	September 1999 overseas arrivals and departures data are revised for movements from, and to, China (excl. SARs and Taiwan) and Hong Kong (SAR of China) in respect of three variables: country of birth, country of citizenship and country of residence/stay. Changes to 'country of birth' and 'country of citizenship' have been made from data supplied by DIMIA. Changes to 'country of residence/stay' have been made by assuming the average proportion of country of birth to country of residence/stay for migrants from China (excl. SARs and Taiwan) and Hong Kong (SAR of China) in September over the last 4 years (1995 to 1998).
