DECEMBER QTR KEY POINTS

ACTUAL EXPENDITURE

- The trend estimate for total new capital expenditure (in volume terms) has decreased by 2.5% this quarter following small decreases in the previous two quarters.
- This decrease was caused by a fall in expenditure on buildings and structures, down 8.3%, continuing the decreases reported in the previous two quarters.
 Expenditure on equipment, plant and machinery remained relatively unchanged.
- The trend estimate for Mining has increased in the past two quarters while the trend estimates for Manufacturing and Other selected industries have decreased.

EXPECTED EXPENDITURE

- Estimate 5 for 2000-2001 is \$40,070m, which is 4.4% lower than Estimate 5 for 1999-2000.
- Estimate 1 for 2001-2002 is \$33,490m, which is 1.7% higher than the corresponding estimate for 2000-2001. Expected expenditure on buildings and structures is 12.0% lower, while equipment, plant, and machinery is 6.8% higher. Expectations for both Mining and Other selected industries are 10.8% and 2.4% higher respectively, while Manufacturing is 5.0% lower.

 For further information about these and related statistics, contact Michael Sharpe on 02 9268 4174, or the National Information Service on 1300 135 070.

CHANGES IN THIS ISSUE There are no changes in this issue.

••••••

REVISIONS TO TREND Readers should exercise care in the interpretation of the trend data as the last

three observations, in particular, are likely to be revised with the addition of $% \left\{ 1\right\} =\left\{ 1\right\} =\left$

subsequent quarters' data.

Dennis Trewin

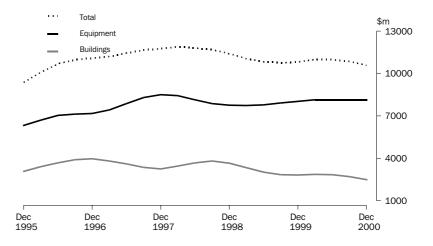

Australian Statistician

QUARTERLY TREND ESTIMATES OF CHAIN VOLUME MEASURES

BY ASSET

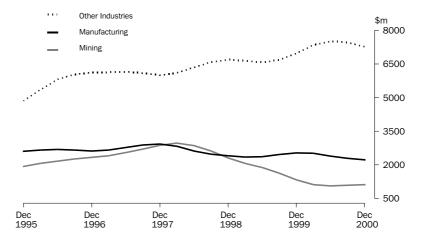

The trend estimate for expenditure on buildings and structures has fallen for the past three quarters following an increase in March quarter 2000. Manufacturing has decreased in the last two quarters and is at the same level as in December quarter 1999. Mining was relatively flat in the current quarter after increasing in September quarter 2000 and decreasing in the previous seven quarters. Other selected industries decreased to its lowest level since December quarter 1997.

The trend estimate for equipment, plant and machinery has been relatively flat for the past three quarters. Other selected industries has increased for the eleventh consecutive quarter. Mining increased for the second quarter running after falling for ten consecutive quarters, while Manufacturing has decreased for the past four quarters.

BY INDUSTRY

The trend estimate for total new capital expenditure by the Mining industry increased slightly for the second consecutive quarter after having fallen since June quarter 1998. Expenditure by Manufacturing has been decreasing since March quarter 2000 after rising for the previous three quarters. The trend estimate for Other selected industries has fallen in the past two quarters, after four quarters of increase.

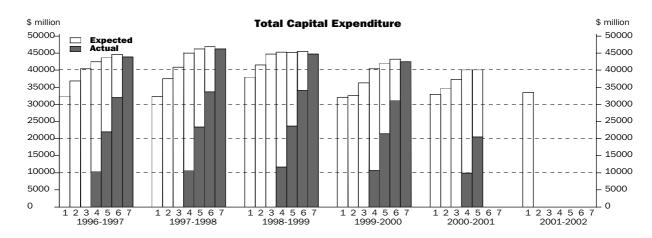

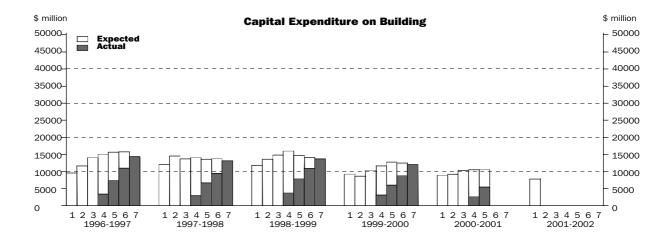

ACTUAL AND EXPECTED NEW CAPITAL EXPENDITURE

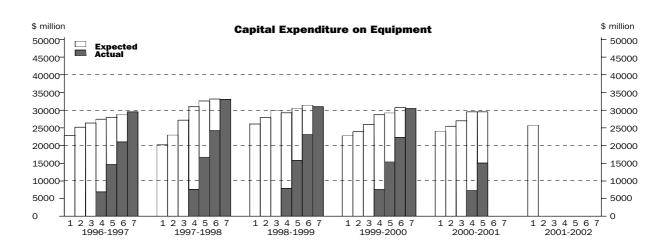

FINANCIAL YEARS AT CURRENT PRICES

EXPENDITURE

The estimates of actual and expected expenditure appearing below relate to data contained in table 4. Information about the timing and construction of these estimates are contained on page 14 and advice about the usefulness of the realisation ratios is on pages 15 and 16.

INTRODUCTION

1 This publication contains estimates of actual and expected new capital expenditure by private businesses for selected industries in Australia. The series have been compiled from data collected by the Australian Bureau of Statistics (ABS) in its quarterly Survey of New Capital Expenditure.

SCOPE OF THE SURVEY

2 The Survey of New Capital Expenditure includes the following industries classified according to the Australian and New Zealand Standard Industrial Classification, ANZSIC, 1993:

Mining (Division B)

Manufacturing (Division C)

Food, beverages and tobacco (21)

Textiles, clothing, footwear and leather (22)

Wood and paper products (23)

Printing, publishing and recorded media (24)

Petroleum, coal, chemical and associated products (25)

Non-metallic mineral products (26)

Metal products (27)

Machinery and equipment (28)

Other manufacturing (29)

Other Selected Industries

Construction (Division E)

Wholesale trade (Division F)

Retail trade (Division G)

Transport & storage (Division I)

Finance and insurance (Division K)

Property & business services (Division L)

Other selected services (including electricity & gas; communication; accommodation, cafes & restaurants; cultural & recreational services; and personal services (36, 37, 57, 71, 91–93, 95)

3 The survey excludes the following industries

Agriculture, forestry and fishing

Government administration & defence

Education

Health and community services

Other services (96)

- **4** The scope excludes public sector business units (i.e. all departments, authorities and other organisations owned and controlled by Commonwealth, State and Local Government).
- **5** The Survey of New Capital Expenditure, like most ABS economic collections, takes its frame from the ABS Business Register which is primarily based on registrations to the Australian Taxation Office's Group Employer Scheme. The frame is updated quarterly to take account of new businesses, cessations, changes in employment levels, changes in industry and other general business changes. Cessations include businesses which have cancelled their Group Employer registration or have not remitted to the Australian Taxation Office for five quarters or more.
- **6** The statistics in this publication generally exclude non-employing businesses which had not registered as group employers with the Australian Taxation Office. Though a substantial number, it is expected that these businesses would not contribute significantly to the estimates, although the impact would vary from industry to industry.

SURVEY METHODOLOGY

- **7** The survey is conducted by mail on a quarterly basis. It is based on a random sample of approximately 6,800 units which is stratified by industry, state/territory and number of employees. The figures obtained from the selected businesses are supplemented by data from units which have large capital expenditure and/or large employment and which are outside the sample framework, or not adequately covered by it.
- **8** Respondents are asked to provide data on the same basis as their own management accounts. Where a particular business unit does not respond in a given survey period, an estimate is substituted. Revisions may be made to these estimates if data are provided subsequently from those businesses. Aggregates are calculated from all data using the 'number raised' estimation technique. Data are edited at both individual unit level and at aggregate level.
- **9** Surveys are conducted in respect of each quarter and returns are completed in the 8 or 9 week period after the end of the quarter to which the survey data relate (e.g. March quarter survey returns are completed during April and May). Full details of the reporting cycle are shown below.

TIMING AND CONSTRUCTION OF SURVEY CYCLE

- **10** Businesses are requested to provide 3 basic figures each survey:
- Actual expenditure incurred during the reference period (Act)

Period to which reported data relates

- A short term expectation (E1)
- A longer term expectation (E2).

1999-2000 2000-2001 2001-2002 Survey quarter Mar Jun Mar Sep Mar Jun Dec Jun Dec Act E1 E2 December 1999 Act Act E1 E2 March 2000 June 2000 Act E1 September 2000 E2 December 2000 F2 March 2001 June 2001 Act Act Act Act E1 E2

11 This survey cycle facilitates the formation of estimates of expenditure for financial years (12 months ending 30 June). For example, as the table above shows, the first estimate for 2000–2001 was available from the December 1999 survey as a longer term expectation (E2). It was subsequently revised in the March 2000 survey (again as a longer term expectation) and in the June 2000 survey as the sum of two expectations (E1 + E2). In the September and subsequent surveys the estimate is derived as the sum of actual expenditure (for that part of the year completed) and expected expenditure (for the remainder of the year). The final (or seventh) estimate from the June quarter 2001 survey, will be derived by summing the actual expenditure for each of the four quarters.

EXPLANATION OF TIMING
OF ESTIMATES

12 The graphs on page 4 and tables 4 and 5 of this publication contain 7 estimates of expenditure for each financial year.

COMPOSITION OF ESTIMATE.....

Estimate	Based on data reported at:	Data on actual expenditure	Data on short- term expected expenditure	Data on long- term expected expenditure

5	Jan-Feb, 6-7 months into period	6 months	6 months	Nil
6	Apr-May, 9-10 months into period	9 months	3 months	Nil
7	Jul-Aug, at end of period	12 months	Nil	Nil

SAMPLE REVISION

- **13** The survey frames and samples are revised each quarter to ensure that they remain representative of the survey population. The timing for creating each quarter's survey frame is consistent with that of other ABS surveys. This provides for greater consistency when comparing data across surveys.
- **14** Additionally, with these revisions to the sample, some of the units from the sampled sector are rotated out of the survey and are replaced by others, to spread the reporting workload equitably.
- **15** Adjustments are included in the estimates to allow for lags in processing new businesses to the ABS Business Register, and the omission of some businesses from the register. The majority of businesses affected and to which adjustments apply are small in size. As an indication of the size of these adjustments, in December quarter 2000 they represented about 3.1% of the total estimate of new capital expenditure.

STATISTICAL UNIT

16 The survey uses the management unit as the statistical unit. The management unit is the highest-level accounting unit within a business, having regard to industry homogeneity, for which accounts are maintained. In nearly all cases it coincides with the legal entity owning the business (i.e. company, etc.). In the case of large diversified businesses, however, there may be more than one management unit, each coinciding with a 'division' or 'line of business'. A division or line of business is recognised where separate and comprehensive accounts are compiled for it.

CLASSIFICATION BY INDUSTRY

- **17** The Australian and New Zealand Standard Industrial Classification (ANZSIC) has been developed for use in both countries for the production and analysis of industry statistics. It replaces the Australian Standard Industrial Classification (ASIC) and the New Zealand Standard Industrial Classification (NZSIC).
- **18** For more information, users are referred to *Australian and New Zealand Standard Industrial Classification (ANZSIC), 1993* (Cat. no. 1292.0).
- **19** In order to classify new capital expenditure by industry, each statistical unit (as defined above) is classified to the Australian and New Zealand Standard Industrial Classification (ANZSIC) industry in which it *mainly* operates.

CHAIN VOLUME MEASURES

20 The chain volume measures appearing in this publication are annually reweighted chain Laspeyres indexes referenced to current price values in the chosen reference year (currently 1998–1999). Chain volume measures were introduced in September quarter 1998, replacing constant price estimates.

- CHAIN VOLUME MEASURES continued 21 The current price value may be thought of as being the product of a price and quantity. The value in chain volume terms can be derived by linking together movements in volumes, calculated using the average prices of the previous financial year, and applying the compounded movements to the current price estimates of the reference year. Each year's quarter-to-quarter growth rates in the chain volume series are based on the prices of the previous financial year, except for those of the quarters of the latest incomplete year which are based upon the second most recent financial year. With each release of the June quarter issue of this publication, a new base year will be introduced and the reference year will be advanced one year to coincide with it. This means that with the release of the June quarter 2001 issue of this publication, the chain volume measures for 2000-2001 will have 1999-2000 (the previous financial year) as their base year rather than 1998–1999, and the reference year will be 1999-2000. A change in reference year changes levels, but not growth rates for all periods. A change in the base year can result in revisions, small in most cases, to growth rates for recent quarters.
 - 22 Chain volume measures are not generally additive. In other words, component chain volume measures do not, in general, sum to a total in the way original current price components do. For capital expenditure data, this means that the original chain volume estimates for industry groups will not add to total capital expenditure for Australia. In order to minimise the impact of this, the ABS uses the latest base year as the reference year. By adopting this approach, additivity does exist for the quarters following the reference year and non-additivity is relatively small for the quarters in the reference year and those immediately preceding it. For further information on chain volume measures refer to the Information Paper: Introduction of Chain Volume Measures in the Australian National Accounts (Cat. no. 5248.0).

DERIVATION AND USEFULNESS OF REALISATION RATIOS

- 23 Once actual expenditure for a financial year is known, it is useful to investigate the relationship between each of the prior 6 estimates of expenditure for that financial year and the actual expenditure (see paragraphs 10-12 above for an explanation of the derivation of the 7 estimates). The resultant realisation ratios (subsequent actual expenditure divided by expected expenditure) then indicate how much expenditure was actually incurred against the amount expected to be incurred at the various times of reporting. Realisation ratios can also be formed separately for 3 or 6 month expectations as well as the 12 month E2 estimates or combinations of estimates containing at least some expectation components (e.g. 6 months actual and 6 months expected expenditure).
- **24** Realisation ratios provide an important tool in understanding and interpreting expectation statistics for future periods. The application of realisation ratios enables the adjustment of expectation data for known under (or over) realisation patterns in the past and hence provides a valid basis for comparison with other expectation data and actual expenditure estimates. Once this has been done the predictions can be more validly compared with each other and with previously derived estimates of actual expenditure for earlier years. For example, if one wished to make a prediction about actual expenditure for 2000-2001 based on the June 2000 survey results and compare this with 1999–2000 expenditure, it is necessary to apply the relevant realisation factors to the expectation to put both estimates on the same basis.
- **25** There are many ways in which realisation ratios can be applied to make predictions of actual expenditure for a future period. A range of realisation ratios for both type of asset and industry estimates is provided in tables 4 and 5.

DERIVATION AND USEFULNESS OF REALISATION RATIOS continued

26 In using realisation ratios to adjust expectations data, attention should be paid to the range of values that has occurred in the past. A wide range of values is indicative of volatility in the realisation patterns and hence greater caution should be exercised regarding the predictive value of the expectation, even after adjustment by application of realisation ratios. This is particularly the case with the early 12 month expectations for the following financial year collected in the December and March surveys.

RELIABILITY OF THE ESTIMATES

- **27** Estimates provided in this publication are subject to non-sampling and sampling errors. Details of sampling errors are on pages 19 and 20 of this publication.
- **28** Non-sampling errors may arise as a result of errors in the reporting, recording or processing of the data and can occur even if there is a complete enumeration of the population. These errors can be introduced through inadequacies in the questionnaire, non-response, inaccurate reporting by respondents, errors in the application of survey procedures, incorrect recording of answers, and errors in data entry and processing.
- **29** It is difficult to measure the size of non-sampling errors. However, every effort is made in the design of the survey and development of survey procedures to minimise their effects.

SEASONAL ADJUSTMENT

- **30** The quarterly actual new capital expenditure series in this publication are affected to some extent by seasonal influences and it is useful to recognise and take account of this element of variation.
- **31** Seasonal adjustment is a means of removing the estimated effects of normal seasonal variations for the series so that the effects of other influences can be more clearly recognised.
- **32** Seasonal adjustment does not remove from the series the effect of irregular or non-seasonal influences (e.g. a change in interest rates) and reflect the sampling and other errors to which the original figures are subject. Particular care should be taken in interpreting quarterly movements in the adjusted figures in this publication, especially for detailed industry estimates. It should be noted that the seasonally adjusted figures necessarily reflect the sampling and other errors to which the original figures are subject.
- **33** At least once each year the seasonally adjusted series are revised to take account of the latest available data. The most recent reanalysis takes into account data collected up to and including the March quarter 2000 survey. Data for periods after March 2000 are seasonally adjusted on the basis of extrapolation of historical patterns. The nature of the seasonal adjustment process is such that the magnitude of some revisions resulting from reanalysis may be quite significant, especially for data for more recent quarters.

TREND ESTIMATES

34 The trend estimates are derived by applying a 7-term Henderson moving average to the seasonally adjusted series. The 7-term Henderson average (like all Henderson averages) is symmetric, but as the end of a time series is approached, asymmetric forms of the average are applied. Unlike the weights of the standard 7-term Henderson moving average, the weights employed here have been tailored to suit the particular characteristics of individual series. While the asymmetric weights enable trend estimates for recent quarters to be produced, it does result in revisions to the estimates for the most recent three quarters as additional observations become available. There may also be revisions because of changes in the original data and as a result of the re-estimation of the seasonal factors.

TREND ESTIMATES continued

35 For further information, see *Information Paper: A Guide to Interpreting Time Series — Monitoring Trends, an Overview* (Cat. no. 1348.0) or contact the Assistant Director, Time Series Analysis on Canberra 02 6242 6345.

DESCRIPTION OF TERMS

- **36** A description of the terms used in this publication is given below:
- **37** *New capital expenditure* refers to the acquisition of new tangible assets either on own account or under a finance lease and includes major improvements, alterations and additions. In general, this is expenditure charged to fixed tangible assets accounts excluding expenditure on second hand assets unless these are imported for the first time.
- **38** Some estimates are dissected by type of asset:
- Buildings and Structures. Includes industrial and commercial buildings, houses, flats, home units, water and sewerage installations, lifts, heating, ventilating and similar equipment forming an integral part of buildings and structures, land development and construction site development, roads, bridges, wharves, harbours, railway lines, pipelines, power and telephone lines. Also includes mine development (e.g. construction of shafts in underground mines, preparation of mining and quarrying sites for open cut extraction and other developmental operations primarily for commencing or extending production). Excludes purchases of land, previously occupied buildings and speculatively built projects intended for sale before occupation.
- Equipment, plant and machinery. Includes plant, machinery, vehicles, electrical apparatus, office equipment, furniture, fixtures and fittings not forming an integral part of buildings, durable containers, special tooling, etc. Also includes goods imported for the first time whether previously used outside Australia or not.

FRAME

39 A list of all members of the target population for a survey. The frame for this survey is a list of all businesses in the ANZSIC divisions, subdivisions and groups listed in paragraph 2. This is extracted from the ABS Business Register, which is a list of all employing Australian businesses, as described in paragraph 5.

COMPARISON WITH OTHER ABS STATISTICS

- **40** The statistics for new capital expenditure shown in this publication differ from estimates of private gross fixed capital expenditure shown in the Australian National Accounts for the following reasons:
 - National Accounts estimates incorporate data from other sources as well as information from the new capital expenditure survey. For example, annual estimates for capital expenditure on 'machinery and equipment' are based on the ABS' annual Economic Activity Survey combined with data from the Australian Taxation Office. Quarterly estimates are interpolated between and extrapolated from the annual estimates using a variety of indicators including this survey. The ABS's quarterly Building Activity Survey and Engineering Construction Survey are the main sources for estimating the National Accounts dwelling and other building and structures items respectively.
 - National Accounts estimates include capital expenditure by all private businesses including units classified to agriculture, forestry and fishing, education, and health and community services industries and capital expenditure on dwellings by households. Data for these sectors are excluded from this publication.

COMPARISON WITH OTHER ABS
STATISTICS continued

- National Accounts estimates include the value of work done on speculative construction projects as the work is put into place. The statistics in this publication, however, include full value of the speculative projects as new capital expenditure of the purchases (if in scope), when the project is sold.
- For machinery and equipment, the National Accounts estimates relate to acquisitions less disposals of all fixed tangible assets whereas the survey figures are acquisitions of new fixed tangible assets only.
- **41** For a more detailed explanation of the concepts and methods used in compiling the National Accounts estimates see *Australian National Accounts: Concepts, Sources and Methods* (Cat. no. 5216.0).

STANDARD ERRORS

INTRODUCTION

The estimates in this publication are based on a sample drawn from units in the surveyed population. Because the entire population is not surveyed, the published estimates are subject to sampling error. The most common way of quantifying such sampling error is to calculate the standard error for the published estimate or statistic.

LEVEL ESTIMATES

To illustrate, let us say that the published level estimate for total capital expenditure is \$10,500m and the calculated standard error in this case is \$173m. The standard error is then used to interpret the level estimate of \$10,500m.

For instance, the standard error of \$173m indicates that:

- There are approximately two chances in three that the real value falls within the range \$10,327m to \$10,673m ($$10,500m \pm $173m$)
- There are approximately 19 chances in 20 that the real value falls within the ranges \$10,154m and \$10,846m (\$10,500m ± \$346m)

The real value in this case is the result we would obtain if we could enumerate the total population.

The following table shows the standard errors for national quarterly level estimates. These standard errors are based on a smoothed average of capital expenditure estimates

	Building and structures \$m	Equipment, plant and machinery \$m	Total \$m
Mining	11	16	36
Manufacturing	16	51	62
Construction	7	35	40
Wholesale trade	5	57	65
Retail trade	7	22	34
Transport and storage	10	40	45
Finance and insurance	3	29	31
Property and business services	52	62	84
Other services	69	36	89
Total	90	124	173

STANDARD ERRORS

MOVEMENT ESTIMATES

The following example illustrates how to use the standard error to interpret a movement estimate. Let us say that one quarter the published level estimate for total capital expenditure is \$10,500m, and the next quarter the published level estimate is \$11,100m. In this example the calculated standard error for the movement estimate is \$221m. The standard error is then used to interpret the published movement estimate of +\$600m.

For instance, the standard error of \$221m indicates that:

- There are approximately two chances in three that the real movement over the two quarter period falls within the range \$379m to 821m ($600m \pm 221m$)
- There are approximately nineteen chances in twenty that the real movement falls within the range \$158m to 1,042m ($600m \pm 442m$)

The following table shows the standard errors for national quarterly movement estimates. These standard errors are based on a smoothed average of capital expenditure estimates.

	Building and structures	Equipment, plant and machinery	Total
	\$m	\$m	\$m
Mining	15	23	49
Manufacturing	22	64	78
Construction	10	48	55
Wholesale trade	7	51	66
Retail trade	11	25	45
Transport and storage	12	49	53
Finance and insurance	5	40	32
Property and business services	74	84	114
Other services	98	46	119
Total	127	153	221

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

Each time new seasonally adjusted estimates become available, trend estimates are revised (see paragraphs 28 to 33 of the Explanatory Notes).

TREND REVISIONS

The examples in the tables below show two scenarios and the consequent revisions to previous trend estimates of capital expenditure by private businesses.

- **1** The March quarter seasonally adjusted estimate of chain volume measures is higher than the December quarter estimate by the percentage shown.
- **2** The March quarter seasonally adjusted estimate of chain volume measures is lower than the December quarter estimate by the percentage shown.

The percentages chosen are approximately the long term average movement, without regard to sign, in the seasonally adjusted series.
