## ABBREVIATIONS

This publication presents information about underemployed workers. The number of underemployed workers is an important component of underutilised labour resources in the economy, along with the number of unemployed and some people with marginal attachment to the labour force. Underemployed workers are part-time workers who want, and are available for, more hours of work than they currently have and full-time workers who worked part-time hours during the reference week for economic reasons. A range of information is presented on underemployed workers including the number of hours usually worked, number of preferred hours, steps taken to find work with more hours, and difficulties finding work with more hours.

The statistics in this publication were compiled from the Underemployed Workers Survey, conducted throughout Australia in September 2006 as a supplement to the Australian Bureau of Statistics (ABS) monthly Labour Force Survey (LFS).

Data from the survey relate to all employed people aged 15 years and over. People who worked less than 35 hours in the week prior to the survey (i.e. the reference week) and who would have preferred to work more hours, were asked about whether they were available to start work with more hours, whether they were looking for work with more hours, and their experience in looking for work with more hours. Other information sought included the duration of the current period of insufficient work and the number of extra hours preferred.

Table 1 is a new table for this issue. Due to interest in underutilised labour resources, it includes three measures of labour underutilisation: the unemployment rate, the underemployment rate and the labour underutilisation rate. A time series for 2000 to 2006 is provided. These are the same measures as published in Australian Labour Market Statistics (cat. no. 6105.0).

As estimates have been rounded, discrepancies may occur between sums of the component items and totals.

CONCEPTUAL FRAMEWORK
The ABS conceptual framework for underemployment separates employed people into two mutually exclusive groups:

- workers who are fully employed
- workers who are not fully employed, comprising:
- part-time workers who would prefer to work more hours
- full-time workers who worked part-time hours in the reference week for economic reasons (such as being stood down or insufficient work being available).

Fully employed workers comprise: employed people who worked full-time during the reference week (includes people who usually work part-time); employed people who usually work full-time but worked part time in the reference week for non-economic reasons (including illness or injury, leave, holiday or flextime, and personal reasons); and part-time workers (usually work part-time and did so in the reference week) who would not prefer additional hours of work.

## CONCEPTUAL FRAMEWORK continued

DEFINITION OF
UNDEREMPLOYMENT

UNDEREMPLOYED
WORKERS SURVEY

The ABS underemployment framework classifies people who are not fully employed into a number of groups based on whether they are available to start work with more hours. The framework separately identifies part-time workers who would prefer full-time hours and those who would prefer more part-time hours. These people are further classified according to whether they were available to start extra work (either in the reference week or in the four weeks subsequent to the survey).

People who usually work full-time, but worked part-time in the reference week for economic reasons, are separately identified in the underemployment framework. It is assumed that these people would prefer to work full-time in the reference week and would have been available to do so.

The ABS definition of the underemployed is consistent with the International Labour Organisation (ILO) definition of time-related underemployment adopted in 1998. According to this definition time-related underemployment exists when the hours of work of an employed person are below a threshold, and are insufficient in relation to an alternative employment situation in which the person is willing and available to engage. More specifically, people in time-related underemployment comprise all employed people (as defined) who satisfy the following three criteria:

- availability to work additional hours, within a specified subsequent period
- willingness to work additional hours - the ILO recommends that those who have actively sought to work additional hours should be distinguished from those who have not
- worked less than a threshold (determined according to national circumstances) relating to working time - the ABS underemployment framework uses a threshold ( 35 hours in the reference week) based on the boundary between full-time and part-time work.

The Underemployed Workers Survey is the primary ABS data source on underemployment. It provides a wide range of information about underemployed workers, including information on the number of hours usually worked, number of preferred hours, steps taken to find work with more hours, and difficulties finding work with more hours. Summary information on underemployed workers is also collected in the Labour Force Survey (LFS) on a quarterly basis.

## SUMMARY OF FINDINGS

## OVERVIEW

PART-TIME WORKERS WHO WOULD PREFER MORE HOURS

There were 10,290,000 employed people aged 15 years and over in September 2006. Of these:

- 576,400 (5.6\%) usually worked part-time and would have preferred to work more hours
- 544,600 (5.3\%) were underemployed workers, comprising:
- 483,900 who usually worked part-time but would prefer more hours and were available to start work with more hours either in the reference week, or in the four weeks subsequent to the interview
- 60,600 who usually worked full-time but worked part-time hours in the reference week due to economic reasons (being stood down, on short time, or having insufficient work). The majority ( $82 \%$ ) of these were men.

Underemployed workers are an important component of underutilised labour resources in the economy, capturing a dimension of such resources not available from the unemployment rate alone. In September 2006 the underemployment rate (underemployed workers as a percentage of the total labour force) was $5.0 \%$. When this is added to the unemployment rate for the same period ( $4.8 \%$ ), the result is the labour force underutilisation rate (9.8\%), which provides a broader indication of the proportion of the population affected by labour underutilisation. The labour force underutilisation rate has continued to decrease from $12.6 \%$ in September 2001 to 9.8\% in September 2006.

In September 2006, there were 2,903,200 part-time workers. Of these, 576,400 (20\%) would have preferred to work more hours compared with 612,000 (22\%) in September 2005. The number of female part-time workers who would prefer to work more hours has decreased from 401,200 (20\%) in September 2005 to 356,100 (17\%) in September 2006. Over this period the proportion of men who would prefer to work more hours has remained fairly constant ( $26 \%$ and $27 \%$ respectively).

Of the part-time workers who would prefer to work more hours, the majority (57\%) would prefer to work full-time. For men, the proportion who preferred to work full-time was $71 \%$ compared with $48 \%$ for women.

Underemployed part-time workers are people who usually work less than 35 hours a week, would prefer to work more hours and are available to work more hours. Of the 483,900 underemployed part-time workers, $57 \%(274,600)$ had looked for work with more hours at some time during the four weeks up to the end of the reference week.

Women made up 61\% of underemployed part-time workers, compared with $66 \%$ in September 2005. Of those underemployed part-time workers who were women, just over half (157,600 or 53\%) were looking for more hours in the reference week or within four weeks.

The median duration of the current period of insufficient work for underemployed part-time workers was 26 weeks. Over one-third (34\%) of underemployed part-time workers experienced 52 weeks or more of insufficient work.

Of underemployed part-time workers:

- 44\% would prefer to work 10-19 extra hours per week
- $30 \%$ would prefer to work less than 10 extra hours per week

## SUMMARY OF FINDINGS continued

UNDEREMPLOYED
PART-TIME WORKERS
continued

- $19 \%$ would prefer to work 20-29 extra hours per week; and
- $7 \%$ would prefer to work an additional 30 hours or more per week.

The mean preferred number of extra hours each week for underemployed part-time workers was 14.4 hours. Men would prefer to work an average of 15.5 extra hours compared with an average of 13.7 extra hours for women. The mean preferred number of extra hours was lowest for people aged 15-19 years (13.3 hours).

The number of additional hours preferred by part-time workers varied with the number of hours they usually worked. Generally, those usually working fewer hours wanted a greater number of additional hours. However, many did not want to work full-time hours. For example, $78 \%$ of those working $1-5$ hours a week wanted fewer than 30 additional hours.

UNDEREMPLOYED PART-TIME WORKERS, PREFERRED NUMBER OF EXTRA HOURS

Underemployed part-time workers who looked for work with more hours were asked to report their main difficulty in finding work with more hours. The most commonly reported main difficulty in September 2006 was 'no vacancies in line of work' (20\%). A further $10 \%$ reported 'unsuitable hours' as their main difficulty.

The most common steps taken to find work with more hours were 'contacted prospective employers' (61\%), 'looked in newspapers' (58\%) and 'asked current employer for more work' (58\%).

(a) Refers to mainly urban areas only. For more information see paragraph 7 of the Explanatory Notes.
(b) Availability refers to 'in the reference week or within four weeks'.

INTRODUCTION

CONCEPTS, SOURCES AND METHODS

SCOPE

1 The statistics in this publication were compiled from data collected in the Underemployed Workers Survey conducted throughout Australia in September 2006 as a supplement to the Australian Bureau of Statistics (ABS) monthly Labour Force Survey (LFS). Respondents to the monthly LFS who fell within the scope of the supplementary survey were asked further questions.

2 The publication Labour Force, Australia (cat. no. 6202.0) contains information about survey design, sample redesign, scope, coverage and population benchmarks relevant to the monthly LFS, which also apply to supplementary surveys. It also contains definitions of demographic and labour force characteristics, and information about telephone interviewing relevant to both the monthly LFS and supplementary surveys.

3 From April 2001 the LFS has been conducted using a redesigned questionnaire containing additional questions and some minor definitional changes. These changes also affect the supplementary surveys. For further details, see Information Paper: Implementing the Redesigned Labour Force Survey Questionnaire (cat. no. 6295.0) and Information Paper: Questionnaires Used in the Labour Force Survey (cat. no. 6232.0).

4 The conceptual framework used in Australia's LFS aligns closely with the standards and guidelines set out in the Resolutions of the International Conference of Labour Statisticians. Descriptions of the underlying concepts and structure of Australia's labour force statistics, and the sources and methods used in compiling these estimates, are presented in Labour Statistics: Concepts, Sources and Methods (cat. no. 6102.0.55.001) which is available on the ABS web site [http://www.abs.gov.au](http://www.abs.gov.au) (Methods, Classifications, Concepts \& Standards).

5 The scope of the LFS is restricted to people aged 15 years and over and excludes the following people:

- members of the permanent defence forces
- certain diplomatic personnel of overseas governments, customarily excluded from the census and estimated populations
- overseas residents in Australia
- members of non-Australian defence forces (and their dependants).

6 Students at boarding schools, patients in hospitals, residents of homes (e.g. retirement homes, homes for people with disabilities), and inmates of prisons are excluded from all supplementary surveys.

7 This supplementary survey was conducted in both urban and rural areas in all states and territories, but excluded approximately 120,000 people living in very remote parts of Australia who would otherwise have been within the scope of the survey. The exclusion of these people will have only a minor impact on any aggregate estimates that are produced for individual states and territories, except the Northern Territory where such people account for around $23 \%$ of the population.

8 The estimates in this publication relate to people covered by the survey in September 2006. In the LFS, coverage rules are applied which aim to ensure that each person is associated with only one dwelling and hence has only one chance of selection in the survey. See Labour Force, Australia (cat. no. 6202.0) for more details.

9 Supplementary surveys are not always conducted on the full LFS sample. Since August 1994 the sample for supplementary surveys has been restricted to no more than seven-eighths of the LFS sample.

10 The initial sample for the September LFS consisted of 37,612 private dwelling households and special dwelling units. Of the 33,885 private dwelling households and special dwelling units that remained in the survey after sample loss (e.g. households selected in the survey which had no residents in scope for the LFS, vacant or derelict
dwellings and dwellings under construction), approximately 31,520 or $93.0 \%$ were fully responding to the Underemployed Workers Survey. The number of completed interviews obtained from these private dwelling households and special dwelling units(after taking into account scope, coverage and subsampling exclusions) was 34,372.

11 Estimates in this publication are subject to sampling and non-sampling errors:

- Sampling error is the difference between the published estimate and the value that would have been produced if all dwellings had been included in the survey. For more information see the Technical Note.
- Non-sampling errors are inaccuracies that occur because of imperfections in reporting by respondents and interviewers, and errors made in coding and processing data. These inaccuracies may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers, and effective processing procedures.

12 The estimates are based on information collected in the survey month and, due to seasonal factors, may not be representative of other months of the year.

13 Country of birth data are classified according to the Standard Australian Classification of Countries (SACC), 1998 (cat. no. 1269.0).

14 Educational attainment data are classified according to Australian Standard Classification of Education (ASCED) (cat. no. 1272.0). See Appendix 1 for more information.

15 Revisions are made to population benchmarks for the LFS after each five-yearly Census of Population and Housing. The last such revision was made in February 2004 to take account of the results of the 2001 Census of Population and Housing. Estimates from supplementary surveys conducted from and including February 2004 are based on the revised population benchmarks.

16 Prior to September 1994, part-time workers who would prefer more hours of work were asked whether they were available to start work with more hours within the subsequent four weeks. From September 1994, an additional question was added to also determine their availability to start work with more hours during the reference week. This question was added to the survey so that estimates of underemployment could be more easily aligned with the then current International Labour Organisation (ILO) recommendations on underemployment.

17 As part of the redesign in 2001 of the LFS questionnaire, people who were on short-term unpaid leave initiated by the employer, are now classified as employed. This approach is consistent with ILO recommendations on formal job attachment. Analysis of data from the LFS shows that many of these people usually worked part time, and that a number of these had a preference to work more hours. However, overall, these people contribute only marginally to the change in part-time workers who would prefer more hours.

18 From July 2004, a change has been made to the category 'considered too young or too old by employers' for the items 'all difficulties in finding work with more hours' and 'main difficulty in finding work with more hours'. The category has been split into 'considered too young by employers' and 'considered too old by employers'.

19 Due to differences in the scope and sample size of this supplementary survey and that of the monthly LFS, the estimation procedure may lead to some small variations between labour force estimates from this survey and those from the monthly LFS.

## EXPLANATORY NOTES continued

COMPARABILITY WITH ILO DEFINITIONS

NEXT SURVEY

ACKNOWLEDGMENT

RELATED PUBLICATIONS

20 Comparability of the concepts and definitions used in the Underemployed Workers Survey are discussed in the Conceptual Framework on page 4. More detailed discussion is included in Labour Statistics: Concepts, Sources and Methods (cat. no. 6102.0.55.001), Chapter 5, which is available on the ABS web site [http://www.abs.gov.au](http://www.abs.gov.au) (Methods, Classifications, Concepts \& Standards).

21 The Underemployed Workers Survey was conducted in May 1985, 1988 and 1991. In 1994, the survey became an annual survey, collected each September. Results of previous surveys were published in: Underemployed Workers, Australia (cat. no. 6265.0); and the standard data service Underemployed Workers, Australia (cat. no. 6265.0.40.001) for 1994 and 1995.

22 The ABS plans to conduct this survey again in September 2007.
23 ABS publications draw extensively on information provided freely by individuals, businesses, governments and other organisations. Their continued cooperation is very much appreciated: without it, the wide range of statistics published by the ABS would not be available. Information received by the ABS is treated in strict confidence as required by the Census and Statistics Act 1905.

24 ABS publications which may be of interest include:

- Job Search Experience, Australia (cat. no. 6222.0)
- Labour Force, Australia (cat. no. 6202.0)
- Labour Force Experience, Australia (cat. no. 6206.0)
- Labour Mobility, Australia (cat. no. 6209.0)
- Labour Statistics: Concepts, Sources and Methods (cat. no. 6102.0.55.001)
- Persons Not in the Labour Force, Australia (cat. no. 6220.0)
- Working Arrangements, Australia (cat. no. 6342.0)
- Australian Labour Market Statistics (cat. no. 6105.0)
- Barriers and Incentives to Labour Force Participation (cat. no. 6239.0)

25 Current publications and other products released by the ABS are listed in the Catalogue of Publications and Products (cat. no. 1101.0). The Catalogue is available from any ABS office or the ABS web site [http://www.abs.gov.au](http://www.abs.gov.au). The ABS also issues a daily Release Advice on the web site which details products to be released in the week ahead.

## APPENDIX 1 EDUCATIONAL ATTAINMENT

CLASSIFICATION OF EDUCATION

In 2001, the ABS Classification of Qualifications (ABSCQ) (cat. no. 1262.0) was replaced by the Australian Standard Classification of Education (ASCED) (cat. no.1272.0). The ASCED is a national standard classification which can be applied to all sectors of the Australian education system including schools, vocational education and training and higher education. ASCED replaces a number of classifications previously used in administrative and statistical systems, including the ABSCQ. The ASCED comprises two classifications: Level of Education and Field of Education.

Level of Highest Educational Attainment can be derived from information on Highest Year of School Completed and Level of Highest Non-school Qualification. The derivation process determines which of the 'non-school' or 'school' attainments will be regarded as the highest. Usually the higher ranking attainment will be self-evident, but in some cases some Secondary Education is regarded, for the purposes of obtaining a single measure, as higher than some Certificate level attainments.
The following decision table is used to determine which of the responses to questions on Highest Year of School Completed (coded to ASCED Broad Level 6) and Level of Highest Non-school Qualification (coded to ASCED Broad Level 5) will be regarded as the highest. It is emphasised that this table was designed for the purpose of obtaining a single value for the output variable Level of Highest Educational Attainment and is not intended to convey any other ordinality.

| Decision Table: Level of Highest Educational Attainment |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ASCED LEVEL OF EDUCATION CODES | Certificate n.f.d. (500) | $\begin{aligned} & \text { Certificate III } \\ & \text { or IV n.f.d. } \\ & (510) \end{aligned}$ | Certificate IV (511) | Certificate III (514) | Certificate I or II n.f.d. (520) | Certificate II (521) | Certificate I (524) |
| Secondary Education n.f.d. (600) | Certificate n.f.d. | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Certificate I or II n.f.d. | Certificate II | Certificate I |
| Senior Secondary Education n.f.d. (610) | Senior Secondary n.f.d. | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Senior Secondary n.f.d. | Senior Secondary n.f.d. | Senior Secondary n.f.d. |
| Year 12 (611) | Year 12 | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Year 12 | Year 12 | Year 12 |
| Year 11 (613) | Year 11 | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Year 11 | Year 11 | Year 11 |
| Junior Secondary Education n.f.d. (620) | Certificate n.f.d. | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Certificate I or II n.f.d. | Certificate II | Certificate I |
| Year 10 (621) | Year 10 | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Year 10 | Certificate II | Year 10 |
| Year 9 (622) | Certificate n.f.d. | Certificate III or IV n.f.d. | Certificate IV | Certificate III | $\left\lvert\, \begin{gathered} \text { Certificate I or II } \\ \text { n.f.d. } \end{gathered}\right.$ | Certificate II | Certificate I |
| Year 8 (623) | Certificate n.f.d. | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Certificate I or II n.f.d. | Certificate II | Certificate I |
| Year 7 (624) | $\begin{aligned} & \text { Certificate } \\ & \text { n.f.d. } \end{aligned}$ | Certificate III or IV n.f.d. | Certificate IV | Certificate III | Certificate I or II n.f.d. | Certificate II | Certificate I |

## APPENDIX 1 EDUCATIONAL ATTAINMENT continued

CLASSIFICATION OF
EDUCATION continued

The decision table is also used to rank the information provided in a survey about the qualifications and attainments of a single individual. It does not represent any basis for comparison between differing qualifications. For example, a person whose Highest Year of School Completed was Year 12, and whose Level of Highest Non-school Qualification was a Certificate III, would have those responses crosschecked on the decision table and would as a result have their Level of Highest Educational Attainment output as Certificate III. However, if the same person answered 'Certificate' to the highest non-school qualification question, without offering any further detail, it would be crosschecked against Year 12 on the decision table as 'Certificate not further defined'. The output would then be 'Year 12'. The decision table, therefore, does not necessarily imply that one qualification is 'higher' than the other.

[^0]
## INTRODUCTION

CALCULATION OF STANDARD ERROR

1 Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, they are subject to sampling variability. That is, they may differ from those estimates that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error (SE), which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three ( $67 \%$ ) that a sample estimate will differ by less than one SE from the number that would have been obtained if all dwellings had been included, and about 19 chances in $20(95 \%)$ that the difference will be less than two SEs. Another measure of the likely difference is the relative standard error (RSE), which is obtained by expressing the SE as a percentage of the estimate.

2 Due to space limitations, it is impractical to print the SE of each estimate in the publication. Instead, a table of SEs is provided to enable readers to determine the SE for an estimate from the size of that estimate (see table T1). The SE table is derived from a mathematical model, referred to as the 'SE model', which is created using data from a number of past Labour Force Surveys. It should be noted that the SE model only gives an approximate value for the SE for any particular estimate, since there is some minor variation between SEs for different estimates of the same size.

3 An example of the calculation and the use of SEs in relation to estimates of persons is as follows. Table 5 shows the estimated number of female underemployed part-time workers was 297,400 . Since this estimate is between 200,000 and 300,000 , table T1 shows that the SE for Australia will lie between 5,300 and 6,350 and can be approximated by interpolation using the following general formula:

## SE of estimate

$$
\begin{aligned}
& =\text { lower } S E+\left(\left(\frac{\text { size of estimate }- \text { lower estimate }}{\text { upper estimate }- \text { lower estimate }}\right) \times(\text { upper } S E-\text { lower } S E)\right) \\
& =5,300+\left(\left(\frac{297,400-200,000}{300,000-200,000}\right) \times(6,350-5,300)\right) \\
& =6,300 \text { (rounded to the nearest } 100)
\end{aligned}
$$

4 Therefore, there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall within the range 291,100 to 303,700 and about 19 chances in 20 that the value will fall within the range 284,800 to 310,000 . This example is illustrated in the following diagram.

5 In general, the size of the SE increases as the size of the estimate increases. Conversely, the RSE decreases as the size of the estimate increases. Very small estimates are thus subject to such high RSEs that their value for most practical purposes is unreliable. In the tables in this publication, only estimates with RSEs of $25 \%$ or less are considered reliable for most purposes. Estimates with RSEs greater than $25 \%$ but less than or equal to $50 \%$ are preceded by an asterisk (e.g.*3.2) to indicate they are subject to high SEs and should be used with caution. Estimates with RSEs of greater than $50 \%$, preceded by a double asterisk (e.g.**0.3), are considered too unreliable for general use

CALCULATION OF STANDARD ERROR continued

MEANS AND MEDIANS

PROPORTIONS AND
and should only be used to aggregate with other estimates to provide derived estimates with RSEs of less than $25 \%$.

6 The RSEs of estimates of mean duration of insufficient work, median duration of insufficient work and mean preferred number of extra hours are obtained by first finding the RSE of the estimate of the total number of persons contributing to the mean or median (see table T1) and then multiplying the resulting number by the following factors:

- mean duration of insufficient work: 1.6
- median duration of insufficient work: 2.5
- mean preferred number of extra hours: 0.7

7 The following is an example of the calculation of SEs where the use of a factor is required. Table 5 shows that the estimated number of male underemployed part-time workers was 186,500 with a median duration of insufficient work of 24 weeks. The SE of 186,500 can be calculated from table T1 (by interpolation) as 5,100. To convert this to an RSE we express the SE as a percentage of the estimate or $5,100 / 186,500=2.7 \%$.

8 The RSE of the estimate of median duration of insufficient work is calculated by multiplying this number ( $2.7 \%$ ) by the appropriate factor shown in paragraph 6 (in this case 2.5): $2.7 \times 2.5=6.8 \%$. The SE of this estimate of median duration of insufficient work is therefore $6.8 \%$ of 24 , i.e. about 2 (rounded to the nearest whole week). Therefore, there are two chances in three that the median duration of insufficient work for males that would have been obtained if all dwellings had been included in the survey would have been within the range $22-26$ weeks, and about 19 chances in 20 that it would have been within the range $20-28$ weeks.

9 Proportions and percentages formed from the ratio of two estimates are also subject to sampling errors. The size of the error depends on the accuracy of both the numerator and the denominator. A formula to approximate the RSE of a proportion is given below. This formula is only valid when x is a subset of y .
$\operatorname{RSE}\left(\frac{x}{y}\right)=\sqrt{[R S E(x)]^{2}-[R S E(y)]^{2}}$

10 Considering the example from paragraph 3 , of the 297,400 female underemployed part-time workers, 102,800 or $34.6 \%$ had insufficient work for 52 weeks and over. The SE of 102,800 may be calculated by interpolation as 4,000 . To convert this to an RSE we express the SE as a percentage of the estimate, or $4,000 / 102,800=3.9 \%$. The SE for 297,400 was calculated previously as 6,300 , which converted to an RSE is $6,300 / 297,400=2.1 \%$. Applying the above formula, the RSE of the proportion is: $R S E=\sqrt{(3.9)^{2}-(2.1)^{2}}=3.3 \%$

11 Therefore, the SE for the proportion of females who have a current period of insufficient work of 52 weeks or more is 1.1 percentage points $(=(34.6 / 100) \times 3.3)$. Therefore, there are about two chances in three that the proportion of females who have a current period of insufficient work of 52 weeks or more was between $33.5 \%$ and $35.7 \%$ and 19 chances in 20 that the proportion is within the range $32.4 \%$ to $36.8 \%$.

## TECHNICAL NOTE DATA QUALITY continued

DIFFERENCES

STANDARD ERRORS

12 Published estimates may also be used to calculate the difference between two survey estimates (of numbers or percentages). Such an estimate is subject to sampling error. The sampling error of the difference between two estimates depends on their SEs and the relationship (correlation) between them. An approximate SE of the difference between two estimates ( $\mathrm{x}-\mathrm{y}$ ) may be calculated by the following formula:
$S E(x-y)=\sqrt{[S E(x)]^{2}+[S E(y)]^{2}}$

13 While this formula will only be exact for differences between separate and uncorrelated characteristics or subpopulations, it is expected to provide a good approximation for all differences likely to be of interest in this publication.

[^1]Centrelink Centrelink is a statutory authority responsible for delivering a range of Australian government services, including registering of people for job search assistance and income support.

## Contributing family worker

Duration of insufficient work

Economic reasons
A person who works without pay in an economic enterprise operated by a relative.
The duration of insufficient work is the length of time underemployed workers have been working less than 35 hours a week. As periods of insufficient work are recorded in full weeks and rounded down, this results in a slight understatement of duration.

Economic reasons for full-time workers having worked less than 35 hours in the reference week include:

- there was no work or not enough work available, e.g. due to material shortages
- they were stood down
- they were on short time.

Employed People aged 15 years and over who, during the reference week:

- worked for one hour or more for pay, profit, commission or payment in kind, in a job or business or on a farm (comprising employees, employers and own account workers); or
- worked for one hour or more without pay in a family business or on a farm (i.e. contributing family workers); or
- were employees who had a job but were not at work and were:
- away from work for less than four weeks up to the end of the reference week; or
- away from work for more than four weeks up to the end of the reference week and received pay for some or all of the four-week period to the end of the reference week; or
- away from work as a standard work or shift arrangement; or
- on strike or locked out; or
- on workers' compensation and expected to return to their job; or
- were employers or own account workers who had a job, business or farm, but were not at work.

Employee A person who works for a public or private employer and receives remuneration in wages, salary, a retainer fee from their employer while working on a commission basis, tips, piece-rates, or payment in kind; or a person who operates his or her own incorporated enterprise with or without hiring employees.
Employer A person who operates his or her own unincorporated economic enterprise or engages independently in a profession or trade, and hires one or more employees.
Full-time workers Employed people who usually worked 35 hours or more a week (in all jobs) or others who, although usually worked less than 35 hours a week, worked 35 hours or more during the reference week.

Employed people who:

- worked full time during the reference week (including people who usually work part time but worked full time in the reference week); or
- usually work full time but worked less than 35 hours in the reference week for non-economic reasons (such as illness or injury, leave holiday or flextime, or personal reasons); or
- part-time workers who would not prefer to work additional hours.

Labour force The civilian population aged 15 years and over can be split into two mutually exclusive groups: the labour force (employed and unemployed people) and persons not in the labour force.

The unemployed plus the underemployed, expressed as a percentage of the labour force.

Level of highest educational attainment identifies the highest achievement a person has attained in any area of study. It is not a measurement of the relative importance of different fields of study but a ranking of qualifications and other educational attainments regardless of the particular area of study or the type of institution in which the study was undertaken. See Appendix 1 for an explanation of how highest level is derived.

Looked for work with more hours at some time during the four weeks up to the end of the reference week.

The mean duration of insufficient work is obtained by dividing the aggregate number of weeks a group has had insufficient work by the number of people in that group.

The mean preferred number of extra hours is obtained by dividing the total preferred number of extra hours reported by a group by the number of people in that group.

The median duration of insufficient work is obtained by dividing underemployed workers into two equal groups, one comprising people whose duration of insufficient work is above the median, and the other comprising people whose duration is below it.

Non-economic reasons for full-time workers having worked less than 35 hours in the reference week include:

- holiday, flextime or study leave
- own illness or injury or sick leave
- standard work arrangements, shift work or rostered day(s) off
- on strike, locked out or took part in an industrial dispute
- bad weather or plant breakdown
- began, left or lost job during the reference week
- personal reasons.

A person who operates his or her own unincorporated economic enterprise or engages independently in a profession or trade, and hires no employees.

Employed people who usually worked less than 35 hours a week (in all jobs) and either did so during the reference week, or were not at work during the reference week.

The number of extra hours a week an underemployed worker would have preferred to work.

The total number of hours per week an underemployed worker would prefer to work.

The week preceding the week in which the interview was conducted.
Employed people classified by whether they were employees, employers, own account workers, or contributing family workers.

All steps taken to find work with more hours during the four weeks up to the end of the reference week.

Underemployed workers are employed people who would prefer, and are available for, more hours of work than they currently have. They comprise:

- part-time workers who would prefer to work more hours and were available to start work with more hours, either in the reference week or in the four weeks subsequent to the survey
- full-time workers who worked part-time hours in the reference week for economic reasons (such as being stood down or insufficient work being available). It is assumed that these people would prefer to work full time in the reference week and would have been available to do so.

The number of underemployed workers expressed as a percentage of the labour force.
The number of unemployed persons expressed as a percentage of the labour force.
The number of hours usually worked in a week.
