KEY POINTS

TREND ESTIMATES

- Growth in the monthly trend estimate of turnover for the Australian Retail and Hospitality/Services series remained weak with a 0.3% increase in May 2004. This follows increases of 0.3% in April and March 2004.
- The trend estimate increased in all states and territories except the Australian Capital Territory which fell. The largest rates of increase were in Northern Territory (+0.7%) and Western Australia (+0.6%).
- The growth in the trend estimate during May 2004 was predominantly driven by an increase in Food retailing (+\$36m or 0.6%). Other retailing recorded a partially offsetting fall (-\$8m or -0.5%).
- Over the three months to May 2004 the trend estimate rose by \$156m. Food retailing (+\$118m) and Hospitality and services (+\$39m) had the largest increases, while Other retailing (-\$25m) had the largest fall.

SEASONALLY ADJUSTED ESTIMATES

- The seasonally adjusted estimate of turnover for the Australian Retail and Hospitality/Services series grew at a moderate rate (+\$76m or 0.5%) in May 2004 compared with April 2004. This growth followed a marginal fall in April 2004.
- New South Wales (+\$45m or 0.8%), Queensland (+\$45m or 1.4%) and the Northern Territory (+\$2m or 1.1%) recorded strong growth. South Australia, the Australian Capital Territory and Tasmania also grew, while Victoria (-\$18m or -0.5%) and Western Australia (-\$3m or -0.2%) recorded falls.

ORIGINAL ESTIMATES

- In original terms, Australian turnover rose by 0.6% in May 2004 compared with April 2004. Chains and other large retailers (which are completely enumerated) rose by 1.0%, while 'smaller' retailers (the sampled units) were flat.
- Australian turnover increased by 5.5% in May 2004 compared with May 2003. Chains and other large retailers increased by 4.4%, while 'smaller' retailers increased by 7.1%.

INQUIRIES

- For further information about these and related statistics, contact the National Information and Referral Service on 1300 135 070 or Graham Phillips on Canberra (02) 6252 5625.

CHANGES IN THIS ISSUE

An appendix 'Contribution of Gambling to Retail Estimates' has been included in this issue with data updated to March quarter 2004.

SAMPLING ERRORS

Standard errors for the Australian estimates (original data) for May 2004 contained in this publication are:

.....

<i>Data Series</i>	<i>Estimate</i>	<i>Standard error</i>
Level of retail turnover (\$m)	15 524.1	141.6
Change from preceding month (\$m)	91.4	38.8
% change from preceding month (%)	0.6	0.3

.....

Estimates for sampled businesses in the first month of each quarter can be influenced by the quarterly rotation of sampled businesses. The aim of the rotation is to spread the reporting load across retailers and to ensure the sample remains representative of the population. At times, the businesses rotated into the sample can perform differently from the businesses they replace or those already in the sample. The potential impact of the quarterly rotation is reflected in the sampling errors for the relevant months.

For more information see the Explanatory Notes, paragraphs 30–34.

INDUSTRY TRENDS

MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

TOTAL RETAIL

The Australian Retail and Hospitality/Services trend estimate has had weak growth for the last four months. Moderate growth in Food retailing and Hospitality and services and weak growth in most other industries was partially offset by declines in Recreational good and Other retailing.

(a) Break in trend series from July 2000

FOOD RETAILING

There has been moderate trend growth for the last 16 months. While most states recorded moderate growth in May 2004, the rate of growth for all states was slower than the previous month.

(a) Break in trend series from July 2000

DEPARTMENT STORES

There has been weak trend growth for the last five months. In May 2004, South Australia recorded moderate growth while Victoria, Queensland and Western Australia had weak growth. New South Wales recorded a small fall.

(a) Break in trend series from July 2000

INDUSTRY TRENDS *continued*

MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

CLOTHING AND SOFT GOOD RETAILING

There has been weak growth in the trend estimate over the last five months. Over the last three months, strong growth in the Northern Territory and moderate growth in Victoria and Queensland have been partially offset by large falls in Western Australia and Tasmania. New South Wales has been flat.

(a) Break in trend series from July 2000

HOUSEHOLD GOOD RETAILING

The rate of growth in the trend estimate has been declining since June 2003, with flat growth in May 2004. In the last three months, strong growth in Queensland and the Northern Territory and moderate growth in Western Australia have been offset by falls in the other states and the Australian Capital Territory.

(a) Break in trend series from July 2000

RECREATIONAL GOOD RETAILING

The trend estimate has been flat or declining in each of the five months to May 2004. In May 2004, Queensland, South Australia, Tasmania and the Northern Territory recorded strong growth, with declines in the other states and the Australian Capital Territory.

(a) Break in trend series from July 2000

INDUSTRY TRENDS *continued*

MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

OTHER RETAILING

The trend estimate continued to fall at a moderate rate in May 2004. Falls continued in New South Wales, Victoria, South Australia and the Australian Capital Territory. Queensland and Western Australia had moderate growth, although the rate of growth in Western Australia has been decreasing over recent months.

(a) Break in trend series from July 2000

TOTAL RETAIL (EXCLUDING HOSPITALITY AND SERVICES)

There was weak trend growth for Total retail (excluding Hospitality and services) in May 2004. The rate of trend growth has been similar to that of Total industries (including Hospitality and services) for the last six months.

(a) Break in trend series from July 2000

HOSPITALITY AND SERVICES

There has been moderate trend growth in each of the six months to May 2004. This follows strong growth in each of the six months to November 2003. In May 2004, strong growth continued in New South Wales, South Australia and Tasmania. Queensland and the Australian Capital Territory continued to decline, but these falls were smaller than in preceding months.

(a) Break in trend series from July 2000

STATE TRENDS

MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

NEW SOUTH WALES

May 2004 was the sixth consecutive month of weak trend growth. Over this period, Food retailing has had moderate growth and Hospitality and services has had strong growth. Household good, Recreational good and Other retailing have been in decline.

(a) Break in trend series from July 2000

VICTORIA

Trend growth weakened again in May 2004, continuing the slowing of growth evident since November 2003. Growth in Food retailing was moderate after strong growth in the preceding five months. In April and May 2004, Household good retailing, Recreational good retailing and Other retailing were in decline.

(a) Break in trend series from July 2000

QUEENSLAND

The rate of trend growth was moderate in May 2004. Over the last three months, Household good retailing and Recreational good retailing have had strong growth. Hospitality and services continued the falls of the past four months.

(a) Break in trend series from July 2000

STATE TRENDS *continued*

MONTHLY SEASONALLY ADJUSTED AND TREND ESTIMATES

SOUTH AUSTRALIA

The rate of trend growth remained moderate in May 2004. There was continuing strong growth in Recreational good retailing and Hospitality and services. Food retailing, Department stores, and Clothing and soft good retailing recorded moderate growth, while Household good retailing and Other retailing fell.

(a) Break in trend series from July 2000

WESTERN AUSTRALIA

The rate of trend growth remained moderate in May 2004. The falls in Clothing and soft good retailing and Recreational good retailing were offset by the weak growth in Department stores and moderate growth in all other industries.

(a) Break in trend series from July 2000

TASMANIA

The trend growth has been weak for the last six months. In May 2004, Hospitality and services and Recreational good retailing grew strongly, while Clothing and soft good retailing and Household good retailing were in decline.

(a) Break in trend series from July 2000

EXPLANATORY NOTES

INTRODUCTION

1 This publication presents monthly estimates of the value of turnover of retail businesses classified by industry, and by state/territory. The principal objective of the series is to show month to month movement of turnover.

2 Estimates of turnover contained in this publication are compiled from the Retail Business survey which includes about 5,200 retail and selected service businesses. All 'large' businesses are included in the survey, while a sample of about 4,100 'smaller' businesses is selected. The 'large' business' contribution of approximately 55% of the total estimate ensures a highly reliable Australian total turnover estimate.

SCOPE AND COVERAGE

3 The scope of the Retail Business survey is all employing businesses with at least one retail outlet. Like most ABS economic surveys, the frame used for the Retail Business survey is taken from the ABS Business Register which includes registrations to the Australian Taxation Office's (ATO) Pay As You Go Withholding (PAYGW) scheme. Each statistical unit (as defined below) included on the ABS Business Register is classified to the Australian and New Zealand Standard Industrial Classification (ANZSIC) industry in which it mainly operates. The frame is supplemented with information about businesses which are classified as non-retail but which have significant retail activity.

4 The frame is updated quarterly to take account of new businesses, businesses which have ceased employing, changes in employment levels, changes in industry and other general business changes. The estimates include an allowance for the time it takes a newly registered business to get on to the survey frame. Businesses which have ceased employing are identified when the ATO cancels their Australian Business Number (ABN) and/or PAYGW registration. In addition, businesses with less than 50 employees which did not remit under the PAYGW scheme in each of the previous five quarters are removed from the frame.

5 The following industries included in the survey are as defined in ANZSIC:

■ Food Retailing

Supermarkets and grocery stores (5110) and non-petrol sales of convenience stores of selected petrol stations

Takeaway food retailing (5125)

Other food retailing

Fresh meat, fish and poultry retailing (5121)

Fruit and vegetable retailing (5122)

Liquor retailing (5123)

Bread and cake retailing (5124)

Specialised food retailing n.e.c. (5129)

■ Department Stores (5210)

■ Clothing and Soft Good Retailing

Clothing retailing (5221)

Footwear, fabric and other soft good retailing

Footwear retailing (5222)

Fabric and other soft good retailing (5223)

■ Household Good Retailing

Furniture and floor covering retailing

Furniture retailing (5231)

Floor covering retailing (5232)

Domestic hardware and houseware retailing (5233)

Domestic appliance and recorded music retailing

Domestic appliance retailing (5234)

Recorded music retailing (5235)

EXPLANATORY NOTES *continued*

SCOPE AND COVERAGE

continued

- Recreational Good Retailing
 - Newspaper, book and stationery retailing (5243)
 - Other recreational goods retailing
 - Sport and camping equipment retailing (5241)
 - Toy and game retailing (5242)
 - Photographic equipment retailing (5244)
- Other Retailing
 - Pharmaceutical, cosmetic and toiletry retailing (5251)
 - Other retailing n.e.c.
 - Antique and used good retailing (5252)
 - Garden supplies retailing (5253)
 - Flower retailing (5254)
 - Watch and jewellery retailing (5255)
 - Retailing n.e.c. (5259)
- Hospitality and Services
 - Hotels and licensed clubs
 - Pubs, taverns and bars (5720)
 - Clubs (Hospitality) (5740)
 - Cafes and restaurants (5730)
 - Selected services
 - Video hire outlets (9511)
 - Hairdressing and beauty salons (9526).

STATISTICAL UNITS DEFINED ON THE ABS BUSINESS REGISTER

6 The ABS uses an economic statistics units model on the ABS Business Register to describe the characteristics of businesses, and the structural relationships between related businesses. The units model is also used to break groups of related businesses into relatively homogeneous components that can provide data to the ABS.

7 In mid 2002, to better use the information available as a result of The New Tax System, the ABS changed its economic statistics units model. The new units model allocates businesses to one of two sub-populations. The vast majority of businesses are in what is called the ATO Maintained Population, while the remaining businesses are in the ABS Maintained Population. Together, these two sub-populations make up the ABS Business Register population.

ATO Maintained Population

8 Most businesses and organisations in Australia need to obtain an ABN, and are then included on the ATO Australian Business Register. Most of these businesses have simple structures; therefore the unit registered for an ABN will satisfy ABS statistical requirements. For these businesses, the ABS has aligned its statistical units structure with the ABN unit. The businesses with simple structures constitute the ATO Maintained Population, and the ABN unit is used as the statistical unit for all economic collections.

ABS Maintained Population

9 For the population of businesses where the ABN unit is not suitable for ABS statistical requirements, the ABS maintains its own units structure through direct contact with each business. These businesses constitute the ABS Maintained Population. This population consists typically of large, complex and diverse businesses. The new statistical units model described below has been introduced to cover such businesses.

Enterprise Group: This is a unit covering all the operations in Australia of one or more legal entities under common ownership and/or control. It covers all the operations in Australia of legal entities which are related in terms of the current Corporations Law (as amended by the Corporations Legislation Amendment Act 1991), including legal entities such as companies, trusts, and partnerships. Majority ownership is not required for control to be exercised.

EXPLANATORY NOTES *continued*

ABS Maintained Population *continued*

Enterprise: The enterprise is an institutional unit comprising (i) a single legal entity or business entity, or (ii) more than one legal entity or business entity within the same Enterprise Group and in the same institutional sub-sector (ie they are all classified to a single Standard Institutional Sector Classification of Australia sub-sector).

Type of Activity Unit (TAU): The TAU is comprised of one or more business entities, sub-entities or branches of a business entity within an Enterprise Group that can report production and employment data for similar economic activities. When a minimum set of data items are available, a TAU is created which covers all the operations within an industry sub-division (and the TAU is classified to the relevant sub-division of the ANZSIC). Where a business cannot supply adequate data for each industry, a TAU is formed which contains activity in more than one industry sub-division.

10 For more information on the impacts of the introduction of the new economic statistics units model, refer to *Information Paper: Improvements in ABS Economic Statistics [Arising from the New Tax System]* (cat. no. 1372.0).

11 Prior to the July 2002 reference month, the Retail Business survey used the management unit as the statistical unit. From the July 2002 reference month onwards, the statistical unit is the ABN unit for businesses with simple structures, and the TAU for businesses with complex structures. In most cases, ABN/TAU units concord with the management units previously used.

SURVEY METHODOLOGY

12 The survey is conducted monthly by both telephone interview and a questionnaire mailed to businesses. The businesses included in the survey are selected by random sample from a frame stratified by state, industry and business size. For the ABS Maintained Population, the ABS uses reported employment as the measure of business size. For the ATO Maintained Population, for which employment data are not updated on a regular basis, the ABS uses a derived size benchmark. The derived size benchmark is a modelled employment size measure, based primarily on wages and salaries from Business Activity Statements or number of payees from the ATO, which is scaled to be the same magnitude as the previous employment benchmark, using current ABS employment data from the Survey of Employment and Earnings.

13 In the first month of each quarter, some businesses in the sample are replaced, at random, by other businesses so that the reporting load can be spread across smaller retailers.

14 Most businesses can provide turnover on a calendar month basis and this is how the data are presented. When businesses cannot provide turnover on a calendar month basis, the reported data and the period they relate to are used to estimate turnover for the calendar month.

15 Most retailers operate in a single state/territory. For this reason, estimates of turnover by state/territory are only collected from the larger retailers which are included in the survey each month. These retailers are asked to provide turnover for sales from each state/territory in which the business operates. Turnover for the smaller businesses is allocated to the state of their head office or main outlet.

DEFINITION OF TURNOVER

16 Turnover includes retail sales; wholesale sales; takings from repairs, meals and hiring of goods (except for rent, leasing and hiring of land and buildings); commissions from agency activity (e.g. commissions received from collecting dry cleaning, selling lottery tickets, etc.); and net takings from gaming machines etc. From July 2000, turnover includes the Goods and Service Tax.

EXPLANATORY NOTES *continued*

DEFINITION OF TURNOVER

continued

17 Turnover presented in the Retail Trade series includes net proceeds from licensed gambling activities undertaken in the Hotels and licensed clubs industry. The impact of net proceeds from gambling on movements in the Retail Trade series was discussed in a feature article 'Contribution of gambling to retail estimates' included in the December 2002 issue of this publication. The article concluded that net proceeds from gambling had not had a significant impact on quarterly movements for the series but net proceeds from gambling had increased over time and users should be aware of this when interpreting the series. Commencing from the February 2004 issue, more up to date data are presented in an appendix in the February, May, August and November issues of this publication.

SEASONAL ADJUSTMENT

18 Seasonally adjusted estimates are derived by estimating and removing systematic calendar related effects from the original series. In the Retail trade series, these calendar related effects are known as seasonal (e.g. increased spending in December as a result of Christmas) and trading day influences (arising from the varying length of each month and the varying number of Sundays, Mondays, Tuesdays, etc. in each month). Each influence is estimated by separate seasonal and trading day factors which, when combined, are referred to as the combined adjustment factors.

19 The seasonally adjusted estimates also have an allowance for an Easter proximity effect, which is caused when Easter falls late in March or early in April. This effect, when present, is combined with the seasonal and trading day factors to form the combined adjustment factors. There is also a similar allowance for the variable timing of Father's Day. See the Appendix of the July 2001 and August 2002 issues respectively of this publication for more information.

20 The Retail series uses a concurrent seasonal adjustment methodology to derive the combined adjustment factors. This means that data from the current month are used in estimating seasonal and trading day factors for the current and previous months. For more information see *Information Paper: Introduction of Concurrent Seasonal Adjustment into the Retail Trade Series* (cat. no. 8514.0).

21 Concurrent adjustment can result in revisions each month to estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the combined adjustment factors for the current month, the previous month and the same month a year ago. The following table shows how the combined adjustment factor for these months, at the total Australian Retail and Hospitality/services level, evolved under the concurrent seasonal adjustment methodology. The table presents two different estimates of the combined adjustment factors. The first row gives the combined adjustment factors estimated following the last annual reanalysis in July 2003 using data up to and including the June 2003 reference month. The second row gives the most recent combined adjustment factors estimated and used in this month's calculation of the concurrent seasonally adjusted series.

COMBINED ADJUSTMENT FACTORS

	May 2003	Apr 2004	May 2004
Factors as estimated at last reanalysis (June 2003 reference month)	0.99253	0.97286	0.96989
Factors as estimated with current month's data (May 2004 reference month)	0.99134	0.97036	0.97149

EXPLANATORY NOTES *continued*

SEASONAL ADJUSTMENT

continued

22 The seasonal adjustment methodology is able to produce combined adjustment factors for future months. The latest factors for some future months are shown in the following table. While these factors represent the best current estimate, the actual factors used for estimating the seasonally adjusted estimates in these months will differ because they will incorporate subsequent months' data as they become available.

COMBINED ADJUSTMENT FACTORS

	Jun 2004	Jul 2004	Aug 2004
Factors as estimated with current month's data (May 2004 reference month)	0.94405	0.98931	0.95870

23 The seasonal and trading day factors are reviewed annually at a more detailed level than possible in the monthly processing cycle. The annual reanalysis will not normally result in significant changes. For Retail Trade, the results of the latest review are usually shown in the July issue each year.

24 In the seasonal adjustment process, both the seasonal and trading day factors evolve over time to reflect changes in spending and trading patterns. Examples of this evolution include the slow move in spending from December to January; and, increased trading activity on weekends and public holidays. The seasonally adjusted estimates still reflect the sampling and non-sampling errors to which the original estimates are subject.

25 As a result of the different treatment of Australian and State totals in the seasonal adjustment process, the Australian total for an industry group may not necessarily equal the sum of the State totals for that industry group.

TREND ESTIMATES

26 The monthly trend estimates are derived by applying a 13-term Henderson moving average to the seasonally adjusted estimates (7-term for quarterly series). The Henderson moving average is symmetric, but as the end of a time series is approached, asymmetric forms of the moving average have to be applied. The asymmetric moving averages have been tailored to suit the particular characteristics of individual series and enable trend estimates for recent periods to be produced. Estimates of the trend will be improved at the current end of the time series as additional observations become available. This improvement is due to the combined effect of the concurrent seasonal adjustment methodology and the application of different asymmetric moving averages for the most recent six months (or three quarters). As a result of the improvement, most revisions to the trend estimates will be observed for the most recent six months (or three quarters).

27 Trend estimates are used to analyse the underlying behaviour of the series over time. As a result of the introduction of The New Tax System, a break in the monthly trend series has been inserted between June and July 2000. Care should therefore be taken if comparisons span this period. For more details refer to the Appendix in the December 2000 issue of this publication.

28 For further information on trend estimates, see *Information Paper: A Guide to Interpreting Time Series — Monitoring Trends, 2003* (cat. no. 1349.0) or contact the Assistant Director, Time Series Analysis on Canberra 02 6252 6345 or by email at <timeseries@abs.gov.au>.

CHAIN VOLUME MEASURES

29 The chain volume measures of retail turnover appearing in the quarterly issue of this publication are annually reweighted chain Laspeyres indexes referenced to current price values in a chosen reference year. The reference year is advanced in each June issue and is currently 2001-2002. Each year's data in the Retail chain volume series are based on the prices of the previous year, except for the quarters of the latest incomplete year. Data for the 2003-2004 financial year will initially be based upon price data for the 2001-2002 financial year. Comparability with previous years is achieved by linking (or chaining) the series together to form a continuous time series. While current price estimates reflect both price and volume changes, chain volume estimates measure changes in value after the direct effects of price changes have been eliminated and hence only reflect volume changes. Further information on the nature and concepts of chain volume measures is contained in the ABS publication *Information Paper: Introduction of Chain Volume Measures in the Australian National Accounts* (cat. no. 5248.0).

RELIABILITY OF ESTIMATES

30 There are two types of error possible in estimates of retail turnover:

Sampling error which occurs because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all establishments in the survey is given by the standard error, see below. Sampling error may be larger for the first month of each quarter, when some of the businesses in the sample are replaced by other businesses so that the reporting load can be spread across retailers.

Non sampling error which arises from inaccuracies in collecting, recording and processing the data. The most significant of these errors are: misreporting of data items; deficiencies in coverage; non-response; and processing errors. Every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures.

STANDARD ERRORS

31 Seasonally adjusted and trend estimates and chain volume measures are also subject to sampling variability. For seasonally adjusted estimates, the standard errors are approximately the same as for the original estimates. For trend estimates, the standard errors are likely to be smaller. For chain volume measures, the standard errors may be up to 10% higher than those for the corresponding current price estimates because of the sampling variability contained in the prices data used to deflate the current price estimates.

32 Estimates, in original terms, that have an estimated relative standard error (RSE) between 10% and 25% are annotated with the symbol '^'. These estimates should be used with caution as they are subject to sampling variability too high for some purposes. Estimates with an RSE between 25% and 50% are annotated with the symbol '*', indicating that the estimates should be used with caution as they are subject to sampling variability too high for most practical purposes. Estimates with an RSE greater than 50% are annotated with the symbol '**' indicating that the sampling variability causes the estimates to be considered too unreliable for general use.

33 To further assist users in assessing the reliability of estimates, key data series has been given a grading of A to E. Where:

- A represents a relative standard error on level of less than 2%. The published estimates are highly reliable for movement analysis;
- B represents a relative standard error on level between 2 and 5%, meaning the estimate is reliable for movement analysis purposes;
- C represents a relative standard error on level between 5 and 10%, meaning users are advised to exercise some caution in interpreting movements for such series;
- D represents a relative standard error on level between 10 and 15% meaning users are advised to exercise caution in interpreting movements for such series; and

ABS DATA AVAILABLE ON REQUEST

35 Retail Survey Special Data Service provides additional retail trade statistics which include further State industry dissections through to 'top ten' industry reports. For more information, contact the Retail Trade Special Data Services manager on Canberra 02 6252 5220.

RELATED PUBLICATIONS

36 Current publications and other products released by the ABS are listed in the *Catalogue of Publications and Products, Australia* (cat. no. 1101.0). The Catalogue is available from any ABS office or the ABS web site <<http://www.abs.gov.au>>. The ABS also issues a daily Release Advice on the web site which details products to be released in the week ahead.

APPENDIX

CONTRIBUTION OF GAMBLING TO RETAIL ESTIMATES

INTRODUCTION

This quarterly appendix presents information about Net proceeds received from licensed gambling activities (hereafter called gambling) undertaken by businesses in the Pubs, taverns and bars and Clubs (hospitality) industries. These industries are called 'Hotels and licensed clubs' in this publication.

Gambling includes:

- commission from TAB and Keno transactions
- net takings from Bingo
- net revenue received from poker machines and other electronic gaming machines¹.

For further background about the gambling series, please refer to the feature article in the December 2002 issue of this publication.

This appendix will be updated on a quarterly basis and included in the issue of this publication for the second month of each quarter.

FINDINGS

Graph A1 compares the growth rate in the Australian Retail and Hospitality/Services turnover series (seasonally adjusted), the same series excluding gambling and the gambling series. The graph shows that for the three quarters to March 2004, Gambling had slightly weaker growth than Total Retail turnover.

A1 PERCENTAGE CHANGE IN QUARTERLY TURNOVER, Seasonally Adjusted

It can be seen from Table A2 that over the period from March quarter 2002 to March quarter 2004, the Total retail series grew by 15.7%, Hotels and licensed clubs grew by 13.5% while gambling grew by 20.6%. In the March quarter 2004, gambling as a percentage of Total Retail turnover was 3.4%.

¹ Each state and territory places some restrictions on the number of gaming machines, whether it be a total cap and/or a cap per hotel or club.

APPENDIX *continued*

FINDINGS *continued*

A2 GAMBLING IN RETAIL TRADE, AUSTRALIA, SEASONALLY ADJUSTED

Quarter	GAMBLING	HOTELS AND LICENSED CLUBS		TOTAL RETAIL	
	Net proceeds	Turnover	Gambling proportion	Turnover	Gambling proportion
	\$m	\$m	%	\$m	%
2002					
March	1 364.6	3 823.4	35.7	41 317.1	3.3
June	1 464.9	3 976.1	36.8	42 292.9	3.5
September	1 590.3	4 028.6	39.5	42 901.5	3.7
December	1 571.6	3 972.1	39.6	43 327.1	3.6
2003					
March	1 624.6	4 089.3	39.7	43 593.1	3.7
June	1 665.9	4 211.6	39.6	44 652.9	3.7
September	1 625.0	4 176.2	38.9	45 793.2	3.5
December	1 662.0	4 374.8	38.0	46 972.3	3.5
2004					
March	1 645.5	4 339.5	37.9	47 790.9	3.4

From Graph A3 it can be seen that in March quarter 2004, gambling as a proportion of state turnover is highest in New South Wales and the Australian Capital Territory and lowest in Western Australia and Tasmania. This relationship between the states has been consistent since the data has been analysed and needs to be considered in the context of the varying state restrictions on gaming machines.

A3 CONTRIBUTION OF GAMBLING TO TOTAL TURNOVER, Seasonally Adjusted—March Quarter 2004

Table A4 shows there was a marked drop in the proportion of gambling as a percentage of Victoria in the December quarter 2002 coinciding with the introduction of restrictions on smoking in pubs and clubs.

SAMPLING ERRORS

Standard errors for the level estimate for Australia (original data) are shown below. The standard error associated with the seasonally adjusted series is approximately the same as for the original estimates.

A5 STANDARD ERRORS

	<i>Estimate</i>	<i>Standard error</i>	<i>Relative Standard error</i>
<i>Data series</i>	\$m	\$m	%
Net proceeds from gambling			
June quarter 2002	1 425.4	63.1	4.4
June quarter 2003	1 620.9	56.7	3.5

FURTHER INFORMATION

For more information about this appendix please contact Graham Phillips on (02) 6252 5625.

RELATED INFORMATION

The ABS produces a more comprehensive range of data on gambling via its service industries program. Detailed surveys of the Pubs, taverns and bars industry, Clubs industry and Casino industry are usually conducted every three years. For more information about the service industries program please contact Graham Boxsell on (02) 6252 5633.

TECHNICAL NOTE REVISIONS TO TREND ESTIMATES

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

1 The most recent trend estimates published in this release are likely to be revised when next month's seasonally adjusted estimates become available. To assist readers of this publication in analysing retail trends, the approximate effect of the two possible scenarios on the previous trend estimates of the percentage change in total retail turnover for Australia are presented below. For more information see the trend estimates section of the explanatory notes.

- 1 The June seasonally adjusted estimate of retail turnover is 1.0% higher than the May estimate.
- 2 The June seasonally adjusted estimate of retail turnover is 1.0% lower than the May estimate.

TECHNICAL NOTE

2 Under concurrent seasonal adjustment, the most recent seasonally adjusted and trend estimates are likely to be revised when original estimates for subsequent months become available. The trend revision is a combined result of the revision of the seasonally adjusted estimates and the revision derived from the use of asymmetric moving averages as future data become available (for more information, refer to paragraph 26 in the explanatory notes). ABS research shows that about 75% of the total revision to the trend estimate at the current end of the time series is due to the use of different asymmetric moving averages when the original estimate for the next time period becomes available. To assess the reliability of the trend estimate at the current end, the "what-if" chart presents trend estimates under two different scenarios of the next time period. The chart shows only the impact due to the changes of the asymmetric moving averages and does not include the unknown impact of revision to seasonal factor estimates that would arise when the original estimate for the next time period becomes available.
