Tare should be taken in the interpretation of month-to-month movements in the original and seasonally adjusted data - see paragraphs 16 and 23 to 27.

#### MAIN FEATURES

The August 1988 estimate (seasonally adjusted) of employed persons was 7,395,900, an increase of 50,900 compared with the July 1988 estimate. The increase was essentially due to a rise (52,000) in the number of employed females in both full-

time (18,400) and part-time (33,600) employment. Trend estimates of employment show continuing growth.

Trend estimates of employed persons show differing patterns from State to State (see graphs on page 2). Following a period of strong growth, employment in New South Wales, Victoria and Tasmania has now levelled off. Trend estimates of the number of employed persons in Queensland and Western Australia continue to grow strongly. In South Australia, the underlying trend is now one of growth, after showing little change during late 1986 and 1987.

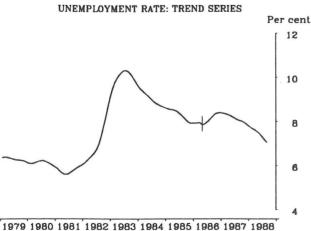

The seasonally adjusted estimate of unemployed persons in August 1988 was 554,600 persons, an increase of 14,000 since July 1988. The main component of the increase was a rise of 15,200 in the number of females unemployed, of whom 13,400 were looking for full-time work. The underlying trend continues to be one of decline, with trend estimates of males and females looking for full-time and part-time work all decreasing.

The August 1988 seasonally adjusted estimate of the unemployment rate was 7.0% - little different from the July estimate of 6.9%. Trend estimates show continuing decline, having fallen by one percentage point from August 1987.

The August 1988 seasonally adjusted estimates of unemployment rates for the States were: Victoria 6.1%, Western Australia 6.8%, New South Wales 7.4%, Queensland 7.6%, South Australia 8.5% and Tasmania 9.0%. State trend estimates of the unemployment rate have decreased in all States during 1988.

The seasonally adjusted estimate of the participation rate for August 1988 was 62.3%, a rise of 0.4 percentage points since the previous month - essentially due to increasing participation by females in the labour force. The female participation rate reached 50% for the third time this year.

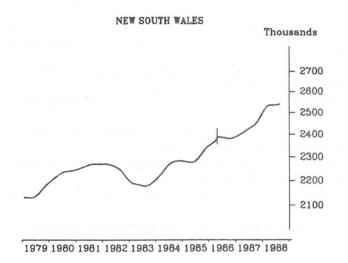

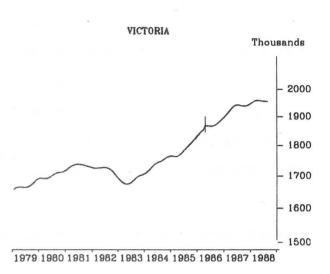

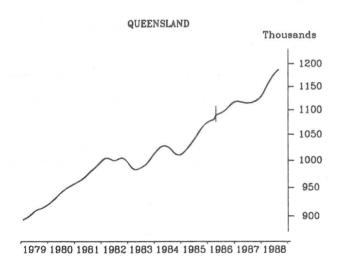

Indicates break in series - see paragraph 15.

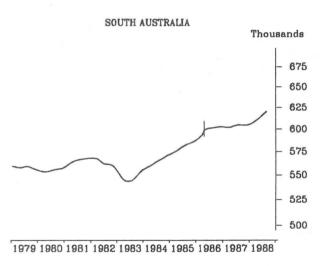

#### **EMPLOYED PERSONS: TREND SERIES**

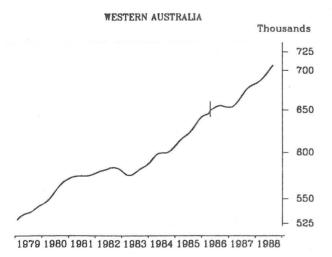

The graphs on this page have been drawn to a semi-logarithmic scale to enable comparisons to be made of rates of change — See paragraph 28.

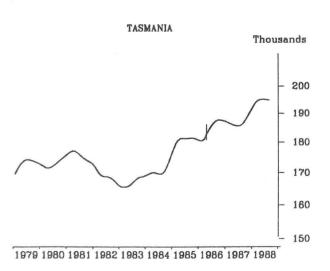

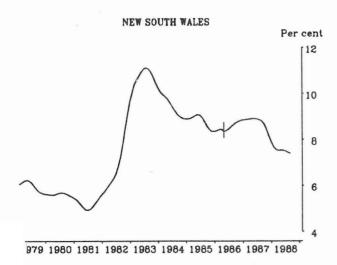

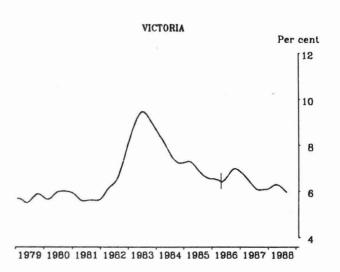

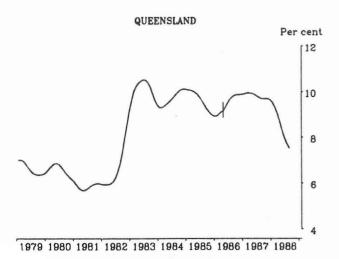

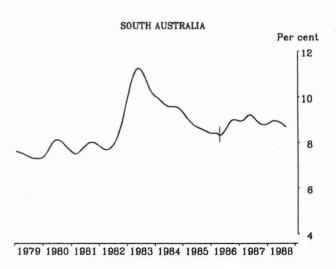

Indicates break in series - see paragraph 15.

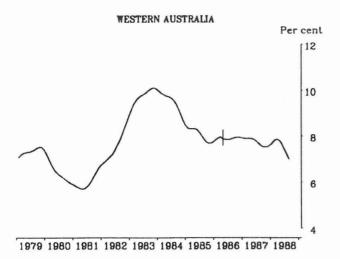

#### **UNEMPLOYMENT RATE: TREND SERIES**

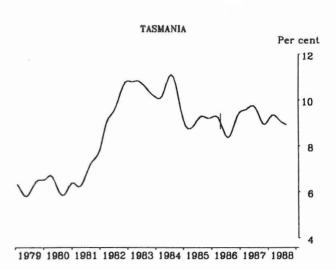

### **EXPLANATORY NOTES**

NOTE. Estimates of persons looking for their first job for the period April 1986 to July 1988 published in issues of *The Labour Force*, *Australia*, *Preliminary* (6202.0) and *The Labour Force*, *Australia* (6203.0) were incorrect. Tables 1,2,3 and 11 of this publication have been revised accordingly. In addition, tables 12 and 13 in this publication show the amended estimates for the period April 1986 to July 1988.

#### Introduction

1. This publication contains preliminary estimates of the civilian labour force derived from the labour force survey part of the monthly population survey. Estimates for the current month are preliminary and subject to revision. Revised estimates for the current month and more detailed estimates will be published in *The Labour Force*, *Australia* (6203.0).

## The population survey

2. The population survey is based on a multi-stage area sample of private dwellings (about 31,000 houses, flats, etc.) and a list sample of non-private dwellings (hotels, motels, etc.), and covers about three-fifths of one per cent of the population of Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the reference week).

#### Scope

3. The labour force survey includes all persons aged 15 and over except: members of the permanent defence forces; certain diplomatic personnel of overseas governments, customarily excluded from census and estimated populations; overseas residents in Australia; and members of non-Australian defence forces (and their dependents) stationed in Australia.

#### Coverage

4. In the labour force survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The coverage rules are, necessarily, a balance between theoretical and operational considerations. Nevertheless, the chance of a person being enumerated at two separate dwellings in the survey is considered to be negligible.

#### **Definitions**

5. The labour force category to which a person is assigned depends on the *actual activity* undertaken during the reference week (i.e. whether working, looking for work, etc.). The following definitions, which conform closely to the international standard definitions specified by the International Labour Office (ILO), relate only to those persons within the scope of the survey.

- 6. Employed persons comprise all those aged 15 and over who, during the reference week:
  - (a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (comprising employees, employers and self-employed persons); or
  - (b) worked for one hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or
  - (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the reference week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the reference week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
  - (d) were employers, self-employed persons or unpaid family helpers who had a job, business or farm, but were not at work.
- 7. Full-time workers are those who usually worked 35 hours or more a week (in all jobs) and others who, although usually part-time workers, worked 35 hours or more during the reference week. Part-time workers are those who usually work less than 35 hours a week and who did so during the reference week. When recording hours of work, fractions of an hour are disregarded.
- 8. Unemployed persons are those aged 15 and over who were not employed during the reference week, and:
  - (a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week and:
    - (i) were available for work in the reference week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the reference week); or
    - (ii) were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or
  - (b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant breakdown.
- 9. Unemployed persons looking for their first full-time job are those who had never worked full time for two weeks or more.

- 10. The *labour force* comprises all persons who, during the reference week, were employed or unemployed, as defined above.
- 11. The *unemployment rate* for any group is the number unemployed expressed as a percentage of the labour force in the same group.
- 12. The *labour force participation rate* for any group is the labour force expressed as a percentage of the civilian population aged 15 and over in the same group.
- 13. Persons not in the labour force are those who, during the reference week, were not in the categories employed or unemployed as defined above.

#### Population benchmarks

14. New benchmarks based on the results of the 1986 Census of Population and Housing will be available in 1988 and are expected to be introduced in the February 1989 issue of this publication. This will result in labour force estimates being revised for the period January 1984 to January 1989. All estimates produced after January 1989 will be based on the new benchmarks.

#### Revision of series

15. From April 1986, the definition of employed persons was changed to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. unpaid family helpers). For further information, see paragraphs 37 and 38 of the Explanatory Notes to the February 1987 issue of *The Labour Force*, *Australia* (6203.0).

## Survey sample redesign

16. The LFS sample has been redesigned and reselected using information collected in the 1986 Population Census. The new sample was phased in over the period September 1987 to December 1987. For details, see *Information Paper - Labour Force Survey - Sample Design* (6269.0).

#### Change in collection methodology

17. For the April to October 1988 surveys information is being collected by telephone interview where practicable, from approximately ten per cent of survey respondents. At the end of this period, consideration will be given to changing to telephone interviewing as the principal method of obtaining survey data.

# Reliability of the estimates

18. Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. The *sampling error* is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all dwellings in the survey is given by the *standard error*. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

- 19. Standard errors of estimates for the latest month and of estimates of movements since the previous month are shown in the tables. Standard errors of other estimates and other movements may be determined by using information in the Technical Note in *The Labour Force*, *Australia* (6203.0).
- 20. The smaller the estimate the higher is the relative standard error. Very small estimates are subject to high standard errors (relative to the size of the estimate) which detract seriously from their value for most reasonable uses. In the tables in this publication, only estimates with relative standard errors of 25 per cent or less, and percentages based on such estimates, are considered sufficiently reliable for most purposes. However, estimates and percentages with larger relative standard errors have been included and are preceded by an asterisk (eg. \* 3.4) to indicate they are subject to high standard errors and should be used with caution.
- 21. Examples of the calculation and use of standard errors are given below:
  - (a) An estimate of 300,000 unemployed males looking for full-time work has a standard error of about 6,600. Therefore there are about two chances in three that the number that would have been produced if all dwellings had been included in the survey will be within the range 293,400 to 306,600 and about nineteen chances in twenty that the number will be within the range 286,800 to 313,200.
  - (b) On an estimate of movement of +28,300 in the number of unemployed males looking for full-time work from one month to the next (with the highest of the two monthly level estimates being 300,000) the standard error is about 5,200. Therefore, there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range +23,100 to +33,500, and about nineteen chances in twenty that it would have been within the range +17,900 to +38,700.
- 22. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in recording and coding of data, and errors made in processing the data. Inaccuracies of this kind are referred to as the *non-sampling error*, and they may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

# Seasonal adjustment and trend estimation

23. Seasonally adjusted series are published in Tables 2, 5 and 9. Seasonal adjustment is a means of removing the estimated effects of normal seasonal variation from the series so that the effects of other influences on the series can be more clearly recognised. Seasonal adjustment does not aim to remove the irregular or non-seasonal influences which may be present in any particular month. Influences

that are volatile can still make it difficult to interpret the movement of the series even after adjustment for seasonal variation.

- 24. It is possible that the seasonality of employment, unemployment and labour force participation has been affected by the changed pattern of school holidays in some States. The impact of these changes on seasonally adjusted estimates of labour force characteristics cannot be assessed at this stage. Trend estimates are expected to be relatively unaffected by these changes.
- 25. Smoothing seasonally adjusted series produces a measure of trend by reducing the impact of the irregular component of the series. The trend estimates have been derived by applying a 13-term Henderson-weighted moving average to the series. Trend series are used to analyse the underlying behaviour of the series over time. These are published in Tables 3, 6 and 10.
- 26. While this smoothing technique enables estimates to be produced for the latest month, it does result in revisions to the most recent months as additional observations become available. Generally, subsequent revisions become smaller, and after three months have a negligible impact on the series. There will also be revisions as a result of the annual review of seasonal factors.
- 27. Users may wish to refer to the ABS Information Papers A Guide to Smoothing Time Series Estimates of 'Trend' (1316.0), and Time Series Decomposition an Overview (1317.0) for more detailed information on smoothing of seasonally adjusted time series data.

# Semi-logarithmic graphs

28. Graphs on page 2 have been drawn using a logarithmic vertical scale to facilitate comparisons of rates of growth in series of differing magnitude. Equal distances on the vertical scale (over equal time periods) indicate equal rates of growth for graphs on the same page.

# Related publications

29. Users may also wish to refer to *The Labour Force*, *Australia* (6203.0). This publication contains a detailed list of related publications which are available on request.

30. Current publications produced by the ABS are listed in the *Catalogue of Publications*, *Australia* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

## Symbols and other usages

- \* subject to sampling variability too high for most practical uses. See the Technical Note in 6203.0 for more details.
- . . not applicable
- r revised
- 31. Estimates have been rounded and discrepancies may occur between sums of the component items and totals.

#### **Electronic services**
