

CHAPTER 25

SCIENCE AND TECHNOLOGY

Introduction

Science and technology directly influence the strength and competitiveness of industry by providing a basis for technological change and thereby encouraging economic growth and development. They can be seen as making major contributions to the achievement of many of Australia's social, economic and industrial goals.

The Government's conviction of the importance of science and technology is reflected in the role and functions of the Department of Science and Technology. Apart from having general responsibility for science and technology, the Department is concerned with the development and maintenance of Australia's scientific and technological capability. Rapid and continuing advances in key technologies, such as micro-electronics and biotechnology, make it imperative that technology policy issues be co-ordinated if Australia is to improve—let alone retain—its share of world markets.

In this context, the Commonwealth Government has identified sixteen high-technology ('sunrise') industries which seem to offer good prospects for development as wealth generators. These industries are in the areas of biotechnology, personal computers, computer software, custom-made computer chips, scientific instrumentation, medical technologies, lasers, communication technology, industrial ceramics, solar technology, shape memory alloys, fusion, robots, intermediate technology projects, hydrogen generation and storage, and biomass. In July 1983 the Government commissioned a major study to evaluate the opportunities for Australia in certain of these key industries.

The Department of Science and Technology

Scope and Policy

The portfolio of the Minister for Science and Technology covers the Department of Science and Technology (with a staff of about 3,200), the Commonwealth Scientific and Industrial Research Organisation (CSIRO), the Australian Industrial Research and Development Incentives Board (AIRDIB), the National Standards Commission, the Australian Institute of Marine Science and the Anglo-Australian Telescope Board. The Department maintains close links with all five organisations.

The Department of Science and Technology was established in November 1980, with a brief to develop the science and technology policy roles which had been brought together for the first time in Australia's history, and to integrate those roles with the industry-oriented programs of the former Department of Productivity.

The Department advises the Minister on a range of policy issues, proposals and submissions from interested parties. It also presents submissions to Parliamentary and other inquiries of relevance to the Department's role and responsibilities. It has regular contact with other Commonwealth and State government departments and statutory authorities in order to assist integration of science, technology and innovation policies with industry, economic and social policies.

The Department helps to stimulate technology in Australia and ensures that Government policies are relevant to the needs of research institutions and industry. Although the Department's activities vary according to Government policy, all current programs can be grouped under the following objectives:

- to stimulate scientific research and technical development in industry, government and academic sectors;
- to facilitate the effective application of technology and the development of technologies having special significance for Australia's industrial growth;
- to facilitate invention and innovation;
- to promote Australia's interests through international co-operation in science and technology;
- to ensure that science and technology issues are considered in the development of government policies, particularly industry and economic policies;
- to improve community awareness of issues relating to science and technology;

- to carry out Australian Government policy as it relates to Antarctica (see entry on Antarctic Division, p 656);
- to provide the national meteorological service (see entry on Meteorology, p 645);
- to provide the national ionospheric prediction service (see entry on Ionospheric Prediction Service, p 646);
- to provide a Government analytical service (see entry on Australian Government Analytical Laboratories, p 645);
- to provide support for foreign space agencies and a national earth-resource satellite system (see entries on p 660 and p 646);
- to provide a national industrial property service to Australia, and to developing countries under international arrangements (see entries on p 642 and p 659).

Technology Development

The Department develops and applies various programs to encourage manufacturing industry to become more competitive and export oriented. One such program is the Manufacturing Technology Development Program which fosters the development and promotion of innovative manufacturing technologies. Projects being undertaken within this program include the development of robots, photovoltaic cells and computer-aided manufacturing techniques.

Departmental activities encourage the innovative use of technology; in the field of biotechnology, for instance, the Department seeks to promote close co-operation among researchers, financiers and others interested in the commercial development of genetically engineered organisms.

An important Departmental function is the promotion of an entrepreneurial attitude to the commercialisation of new products and processes. With the Department's assistance, the Victorian Chamber of Manufacturers has established an Innovation Centre which promotes interaction between inventors and manufacturers, and facilitates the introduction of new products and processes to the manufacturing industry. The Centre gives inventors access to the information, expertise, services and facilities needed to carry inventions from the initial stage of technical and economic evaluation to the market place. Similar centres have been established in New South Wales and Western Australia, and are being planned in other States. As well, the Department administers the Assistance to Inventors' Scheme which supports individuals with grants and advice to develop inventions.

The Department is responsible for a number of programs aimed at transferring technology from innovative sources to manufacturers. These programs are concerned with information technology awareness, manufacturing technology transfer and the formation and support of research associations.

On the initiative of the Minister for Science and Technology, a National Technology Conference was organised by the Department in Canberra in September 1983; the conference was attended by representatives from industry, trade unions, universities, the CSIRO and Commonwealth and State government departments. Its aims were to achieve greater awareness of the range and speed of the technological revolution, and to work out strategies enabling Australia to profit from this revolution. The conference has provided a basis for the development of a National Technology Strategy.

Financial Support for Research

The Department administers three categories of funding schemes in support of:

- Basic research, through the Australian Research Grants Scheme (ARGS);
- Industrial research, through the Australian Industrial Research and Development Incentives Scheme (AIRDIS);
- Mission-oriented research, for instance through the Marine Sciences and Technologies Research Grants Scheme.

ARGS: The ARGS provides support for basic research in a range of subjects at universities and other non-government institutions. ARGS grants for 1984 total \$22.4m. In addition, under the Queen Elizabeth II Fellowships Scheme, up to 10 two-year post-doctoral fellowships are provided for young scientists to carry out research in the physical and biological sciences at institutions in Australia.

AIRDIS: Under the Industrial Research and Development Incentives Act, three forms of assistance are available to industry: commencement grants, project grants and public interest projects. Commencement grants, each available for five years and with an annual limit of \$40,000, encourage the growth of industrial R & D capability in mainly small and medium-size companies. Project grants, with an annual limit of \$750,000 per company, assist companies with an established R & D capability to undertake specific and significant R & D projects. Public interest projects involve the placement of contracts by the Commonwealth for work on industrial research projects with the potential to benefit Australia. Projects in progress cover water treatment, food processing, agricultural technology, biomedical engineering, processing technologies of metals, the use of computers and micro-electronics in heavy engin-

engineering and information applications, and a \$3.4m feasibility study for STARLAB (a joint Australian-Canadian-US proposal to place a telescope in earth orbit in 1989). Total funds provided for AIRDIS grants and projects in 1983-84 were \$71.6m.

Mission-Oriented Research: Grants are made to a number of organisations in aid of research or service to the community. In particular, there is active Government support for marine research. The Marine Sciences and Technologies Research Grants Scheme assists universities and other organisations with projects involving, for example, the Great Barrier Reef, Bass Strait and the North West Shelf; Queen's Fellowships in Marine Science provide post-graduate research opportunities at Australian institutions. Through the portfolio of the Minister for Science and Technology, a total of about \$20.9m was provided for marine research in 1982-83; recipients of funds included the CSIRO, the Australian Institute of Marine Science, The Department's Antarctic Division and individual research workers.

The Patent, Trade Marks and Design Office

This Office is part of the Department of Science and Technology. It administers systems for the protection of inventions, the registration of trade marks and industrial designs and provides a patent information service. This service publicises information on technology by disseminating information contained in patent specifications. The Office contributes advice and expertise to other areas of the Department and to government agencies involved in encouraging inventions and technological innovation. It also represents Australia's interests in the World Intellectual Property Organisation (a United Nations agency) and a number of important international treaties concerned with industrial property, notably the Patent Co-operation Treaty (PCT).

In Canberra, the Office maintains the largest technology library in the Southern Hemisphere, with some 22 million patent documents from about forty countries. Access is provided to interested persons and a selected coverage is available through the State branches.

Each year the Office examines about 8,000 patent applications, 15,000 applications for registration of trade marks and 2,500 applications for registration of industrial designs. It also issues about 200 international search reports a year for international applications under the PCT. With further computerisation of information management systems, these levels are expected to increase.

For details of the Australian Patent Information Service, see Resources and Services in this chapter.

Advice and Co-ordination

National Advisory Bodies

Australia has several agencies with policy and funding responsibilities for various aspects of science and technology. In order to achieve integration of advice, relative assessment of priorities and the development of broad strategies for future directions, several national advisory bodies, in addition to government departments such as the Department of Science and Technology and the Department of Resources and Energy, have been established; the major ones are:

- The Australian Science and Technology Council;
- The National Energy Research, Development and Demonstration Council (See Chapter 18, Energy);
- The Australian Manufacturing Council.

Australian Science and Technology Council (ASTEC): ASTEC was established as a statutory authority in February 1979 under the Australian Science and Technology Council Act 1978. The Council reports to the Prime Minister and is the Government's principal source of independent advice on science and technology matters. As part of this role, it maintains an overview of the science and technology activities of Commonwealth Government departments and agencies, universities and private enterprise.

The functions of the Council are to investigate, and to advise the Commonwealth Government on matters relating to science and technology, such as:

- the advancement of scientific knowledge;
- the development and application of science and technology in relation to the furtherance of the national well-being;
- the adequacy, effectiveness and overall balance of scientific and technological activities in Australia;
- the identification and support of new ideas in science and technology likely to be of national importance;
- the practical development and application of scientific discoveries;
- the fostering of scientific and technological innovation in industry; and

- the means of improving efficiency in the use of resources by the application of science and technology.

Australian Manufacturing Council (AMC): The AMC was established in 1977. New arrangements, enlarging the role of the Council were instituted by the incoming Government in 1983. The Council advises the Minister for Industry and Commerce on matters of concern to the manufacturing sector and acts as a forum for discussion and consultation on such matters.

Other official advisory bodies have been established to deal with activities, interests and responsibilities of the Commonwealth Government and its agencies, and to advise on Government support of higher education and of industry. Amongst these bodies are the National Health and Medical Research Council; the CSIRO Advisory Council and its State Committees; the Rural Industry Research Fund Advisory Committees and the Commonwealth Tertiary Education Commission.

Other Organisations

Advice to government on scientific and technological issues comes also from various learned and professional bodies. Advice may be offered on the initiative of the organisation itself or in response to an official request. For example, the Australian Academy of Science maintains a number of national and standing committees which specialise in selected broad fields of science; ad hoc advisory committees are appointed by the Academy to examine and report on specific matters.

Since 1967 the Academy has maintained a Science and Industry Forum which brings together leading scientists and industrialists to discuss topics of national significance; a complementary Science and Society Forum was inaugurated in 1973. Communication between government and the technology area of the science-technology spectrum is facilitated by the Australian Academy of Technological Sciences.

The most broadly based of the learned and professional bodies is the Australian and New Zealand Association for the Advancement of Science (ANZAAS) which is concerned with all fields of the natural and social sciences. It encourages interdisciplinary communication and information dissemination through national conferences, State programs and the bi-monthly magazine, *Search*.

There are a number of groups within the industry sector—eg. the Australian Industrial Research Group (AIRG) and some specialist panels (Industry Advisory Councils) of the Australian Manufacturing Council (AMC)—which, from time to time, provide advice to government on industrial research and development.

Intergovernmental co-ordination is effected through Ministerial councils established for the purpose. While some of these councils are concerned with promoting research and scientific and technical services, they do not directly undertake research or provide services. Typical of these bodies are the Australian Agricultural Council, the Australian Minerals and Energy Council, the Australian Water Resources Council, and the Australian Environment Council. In some instances, councils have control of research funds and provide grants or arrange for projects to be undertaken in particular fields of interest.

In some scientific and technical fields not coming directly within the scope of the Ministerial councils, there are standing arrangements at agency level for consultation and co-operation (the Electricity Supply Association of Australia is an example).

The Building Research and Development Advisory Committee is the main link between private industry and the CSIRO Division of Building Research, the Department of Housing and Construction, and the Physical Working Environment Branch of the Department of Employment and Industrial Relations.

The Australian Water Resources Council (AWRC) was established in 1963 and is a Commonwealth and State Ministers' forum for dealing with water resources matters. Commonwealth and State collaboration through the AWRC has concentrated on resources assessment and research, but more recently the Council's functions have been expanded to include management and planning. The AWRC and its committees have provided an important contribution to the development of Commonwealth water policies and programs and, in many cases, provide the means of implementing them.

The Department of Resources and Energy administers a water research program, developed through the AWRC and funded by the Commonwealth at a cost of about \$600,000 a year. The program covers basic and applied research into all aspects of water resources and is used to stimulate new work not handled elsewhere. In 1982 the Commonwealth Government decided to end the program when the then current projects were completed.

Resources and Services

Although power to regulate the development and utilisation of Australia's natural resources rests largely with the States, the Commonwealth Government, in part because of its jurisdiction in the control of Australia's overseas trade, also plays an important role. Extensive machinery exists for consultation and collaboration between the Commonwealth and State governments in relation to the development and management of natural resources.

Several important resources and services are dealt with elsewhere in this Year Book and are thus not included in this chapter. These include Health (Chapter 10), Agricultural Industries (Chapter 13), Forestry and Fisheries (Chapter 14), Water Resources (Chapter 15), Mineral Industry (Chapter 16), Transport and Communications (Chapter 20) and Environment (Chapter 26).

Soil Resources

A Standing Committee on Soil Conservation was established in 1946. It comprises the heads of soil conservation bodies in the States and representatives of the Department of Primary Industry and the CSIRO. The Committee advises the Australian Agricultural Council on matters relating to soil conservation.

Australian Government Analytical Laboratories (AGAL)

AGAL, part of the Department of Science and Technology, provides valuable chemical and microbiological research and services to assist the Commonwealth Government in protecting public health, collecting import duties, enforcing laws against importing illicit drugs and certifying the quality of exports.

With laboratories in Sydney, Melbourne, Adelaide, Perth and Hobart, AGAL conducts more than 160,000 tests a year, mainly for Commonwealth bodies such as the Department of Primary Industry (primary produce), the Australian Customs Service (goods for tariff classification, trade description, spirits, unsafe goods, fertilisers and illicit drugs) and the Department of Health (pharmaceuticals, food, narcotics, sunscreen preparations and cigarettes).

In recent years AGAL has undertaken species testing of meat; detected substitution of barramundi with cheaper fish, and adulteration of honey and spirits; examined salami sausages in connection with a food-poisoning outbreak in Victoria; and analysed imported wound dressings and locally produced powdered infant foods for bacterial contamination.

The laboratories' chemists work closely with the Australian Federal Police in analysing suspected illicit substances and drugs, and providing expert testimony in court cases. AGAL also co-operates with CSIRO, Commonwealth Serum Laboratories, National Biological Standards Laboratory, Standards Association of Australia, National Association of Testing Authorities and a number of international bodies.

Australian Patent Information Service (APIS)

APIS exists to encourage and assist industry to extract technological information from the major industrialised nations' patent specifications. APIS information Officers based in Canberra, Melbourne and Sydney can assist industry by conducting technology searches, by providing information on the activities in specialist fields and by providing general overviews of particular technology areas, etc.

Recent initiatives have included improvement of public-search files in Patent Sub-offices, in particular US and UK patent files and Australian design files; and a solar-energy evaluation of patent literature conducted by the Technological Evaluation Unit. APIS provides its information on a fee-for-service basis, and quotations will be provided prior to the commencement of a technology search or competitor watch service.

Meteorology

The Bureau of Meteorology, part of the Department of Science and Technology, operates under the *Meteorology Act 1955*. As Australia's national meteorological authority, its basic mission is to explore Australia's weather and climate and to apply the knowledge gained to the provision of meteorological services to meet Australia's national needs and international obligations.

The Bureau has an operational staff of about 1,650 personnel employed throughout Australia and its Territories (including Antarctica). It has a Head Office in Melbourne, Regional Forecasting Centres in each capital city, Canberra and Darwin, 28 Weather Service Offices at major airports and RAAF bases, and 35 observing offices at other centres.

Users of Bureau services include the general public, defence forces, civil aviation and marine authorities, and specialist groups in primary and secondary industries. Apart from forecasting services, the Bureau satisfies many requests for data from the National Climatological Data Bank.

Programs of research are carried out in support of these services, often in co-operation with other institutions concerned with atmospheric science, including universities, the CSIRO and the Australian Numerical Meteorology Research Centre. Major research topics include numerical modelling techniques for predicting atmospheric behaviour, better use of data derived from satellites, tropical cyclones and cold fronts.

Ionospheric Prediction Service (IPS)

The Ionospheric Prediction Service Branch of the Department of Science and Technology assists users of radio communications to achieve the most effective and efficient use of radio communication which is influenced by or dependent on the ionosphere. The Branch operates ionospheric and solar observatories in Australia and Papua New Guinea, and produces radio propagation predictions and warnings of ionospheric and magnetic disturbances. The IPS also conducts research into physical phenomena affecting the ionosphere and into radio wave propagation.

National Materials Handling Bureau

The National Materials Handling Bureau of the Department of Science and Technology carries out research, development and promotion relating to the application of improved materials handling, including the equipment, systems, standards, methods, management and control aspects involved in the supply, production, movement, packaging, storage and distribution of goods and materials.

Satellite Remote Sensing

In 1978 the Commonwealth Government decided to establish facilities for receiving and processing information from the US National Aeronautics and Space Administration's series of Landsat satellites. The Department of Science and Technology operates the facilities. A data-acquisition station is located at Alice Springs, with a data-processing facility in Canberra. Additional information on Landsat stations is provided in Year Book No. 64, pp. 722-724.

Scientific and Technological Information Services

Scientific literature and technical information for scientists and technologists is provided through library and information services provided by the Commonwealth of Australia, State Government instrumentalities, tertiary institutions and industrial organisations. The more important scientific libraries and information services within the Commonwealth sector are the National Library of Australia, the CSIRO Library network and information services, and the libraries and information services maintained by the Department of Health and the Australian Atomic Energy Commission.

Several Commonwealth agencies, including the Australian Atomic Energy Commission, the Australian Road Research Board and the National Library of Australia, are now offering Australian users access to bibliographic data bases via a commercial computer service bureau (AUSINET). The Australian Mineral Foundation provides an earth-resource data base. The National Library of Australia and the Department of Health operate a national health information network, the Australian Medline Network. The CSIRO provides access to data bases on CSIRONET. The Overseas Telecommunications Commission is operating an international data transmission service known as MIDAS (Multi-mode International Data Acquisition Service) which has facilitated low-cost access to international data stores in North America and Europe.

Another overseas trend in which Australian scientists are showing interest is the development of numerical data bases which provide quick access to factual data. The CSIRO is currently operating Thermodata, a metallurgical thermodynamic data base and other similar data bases in crystallography and mass spectra data. Similar numeric and factual data bases are at present being evaluated by other Commonwealth agencies.

A number of Australian scientific and technological indexes and directories now exist or are in the course of production by Commonwealth Government departments and agencies. Recent initiatives are:

- a computer-based register of Australian energy research, development and demonstration projects containing an outline of the objectives, methodology and status of each project. The register is maintained by the CSIRO on behalf of the Department of Resources and Energy and contains references to nearly 1 000 projects. It is used to generate annual updates of the Compendiums of Australian Energy Research Development and Demonstration Projects;
- a national directory of current Australian marine research. The Directory of Australian Marine Research in progress, is a joint publication by the Department of Science and Technology, the Victorian Institute of Marine Sciences and the Great Barrier Reef Marine Park Authority. The Directory identifies individuals and organisations undertaking marine research and provides details of their objectives, methodology, publications, current status and funding.

- a computerised bibliographic data base, STREAMLINE, providing references to published and unpublished documents and current research projects on all facets of water and wastewater in Australia, has been established by the Department of Resources and Energy in association with State water agencies. The data base is publicly available on AUSINET, and a regular current awareness bulletin and a directory of research projects are produced.

Technology Transfer Council (TTC)

The TTC was established initially for a three-year pilot period in 1979 to provide a technical referral program aimed at utilising the technological expertise resident in academic, government and private research institutions and to assist in the effective use of existing technology in Australian industry. A network of eight centres in the five major mainland capitals is initially assisting the metals manufacturing industry. The focus is on small-to-medium-size firms which do not have the in-house technical expertise to devote to problem solving and which lack awareness of technologies available. With continuing Commonwealth support over the next three years, the TTC is expanding its operations from the pilot stage towards a viable long-term program.

Units and Standards of Physical Measurement

The National Standards Commission is responsible for determining the legal units and standards of physical measurement, and the suitability of measuring instruments in use. It advises the Minister for Science and Technology on all aspects of weights and measures.

The existing measurement system is in the process of being updated so that it can meet the requirements of rapidly changing technology. New legislation has been prepared, and recommendations on responsibilities and funding are being put to a forthcoming Ministerial Conference. In order to establish a unified approach to measurement, action has also been taken to bring together the many organisations with an interest in this area.

Information Technology Week

The National Information Technology Week Committee was established in 1979 as an initiative of the Department of Productivity (now Science and Technology) in conjunction with the Australian Computer Society Inc. The Committee conducts an annual Information Technology Week throughout Australia, designed to focus public attention on the present and future uses of information-handling equipment and systems including communications, computers, videotex, word processors and micrographics.

RESEARCH AND DEVELOPMENT

Much of the early history of Australian science was based largely on the individual achievements of a few outstanding scientists.

During and after World War I, governments in various parts of the world took initiatives aimed at encouraging scientific research and applying it to economic growth and national development; Australia was no exception. In 1926 the Council for Scientific and Industrial Research (CSIR) was established by the Commonwealth Government. Initially, it concentrated its efforts on the primary industries, typifying the trend of research in Australia at the time, when most major research initiatives were taken by Government and aimed at the primary industries. The level of research in the universities and industries remained much as before.

With the approach of World War II, however, moves were made to extend scientific support for secondary industry. In the CSIR, Divisions created in the period 1937-40 were to play an important part in the rapid development of Australian industry which occurred under the stimulus of war-time needs.

Expansion of scientific research in general, and industrial research in particular, continued after the war. This expansion extended beyond government into the universities and industry.

Though even today agricultural research absorbs a significant proportion of Australia's research effort, industrial, medical and defence research are now of major importance also. The volume of research in the social sciences and humanities remains small, although in Australia, as elsewhere in recent years, there has been increasing support for the view that adequate weight must be given in governmental policy-making to the social aspects of national proposals.

For details of expenditure and human resources devoted to research, see section below.

Expenditure and Human Resources Devoted to Research and Experimental Development

Project SCORE (Survey and Comparisons of Research Expenditures) provides details of Australian expenditure on research and experimental development activities. It should be noted however

that it does not provide comprehensive data on all resources devoted to scientific and technological activities in Australia. Programs not covered by Project SCORE, some of which involve large expenditures, are those which have no research and development component; such programs include many of those aimed at providing scientific or technological services.

The first comprehensive survey on research and experimental development (R & D) was carried out for the financial year 1968-69. There have been four subsequent surveys, the latest being in respect of 1981-82 (1981 calendar year for the Higher Education Sector).

The estimate of gross expenditure on R & D (GERD) carried out in Australia, as derived from the results of the latest survey, is \$1,522m. This represents a 44 per cent increase compared with the 1978-79 Survey. At constant (1979-80) prices, GERD has increased by 4 per cent over the same period. The total estimate of human resources devoted to R & D in Australia is 44,535 man-years; this compares with 43,643 man-years for the previous survey.

Survey Methods and Concepts. The Project SCORE surveys measure R & D expenditure and human resources in the natural and social sciences in the major sectors of the Australian economy. For the purposes of Project SCORE, four sectors are recognised: Business Enterprises (public and private business enterprises, excluding those mainly engaged in agriculture, forestry, fishing and hunting); General Government (all State and Commonwealth Government organisations but excluding Local government organisations); Higher Education (Universities and Colleges of Advanced Education), and Private non-Profit (private or semi-public organisations which are not established with the aim of making a profit). The surveys are conducted by means of mailed questionnaires and, in order to provide direct comparisons with other OECD countries, follow guidelines described by the OECD for national R & D surveys. The OECD defines R & D as comprising "creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society, and the use of this stock of knowledge to devise new applications".

For further details concerning survey methods and concepts see the ABS bulletins mentioned below.

Survey Results. A summary of results for 1968-69 is given in Year Book No. 60. Results for the second survey, 1973-74 (1974 calendar year for the Higher Education Sector); the third survey, 1976-77 (1976 calendar year for the Higher Education Sector), and the fourth survey, 1978-79 (1978 calendar year for the Higher Education Sector) are given in Year Books No. 61, 64 and 67 respectively.

Detailed results for the fifth survey, 1981-82 (1981 calendar year for the Higher Education Sector) are contained in the ABS publications: *Research and Experimental Development, Business Enterprises, Australia, 1981-82* (8104.0); *Research and Experimental Development, General Government Organisations, Australia, 1981-82* (8109.0); *Research and Experimental Development, Higher Education Organisations, Australia, 1981* (8111.0); *Research and Experimental Development, All Sector Summary, Australia 1981-82* (8112.0). Results for the Private non-Profit Sector are included in catalogue 8112.0.

A summary of results from the fifth survey is presented below.

Business Enterprise Sector. The estimate of expenditure on R & D carried out in Australia by private and public business enterprises during 1981-82 is \$341m at *current* prices. This represents a 39 per cent increase in expenditure compared with 1978-79. At *constant* (average 1979-80) prices, R & D expenditure is estimated to have decreased by 2 per cent over the same period.

The estimate of manpower effort devoted to R & D carried out in Australia by business enterprises during 1981-82 is 7,923 man-years. This represents a decrease of 8 per cent compared with 1978-79.

A summary of Business Enterprise R & D data for 1981-82 is shown in the tables below.

**RESEARCH AND EXPERIMENTAL DEVELOPMENT CARRIED OUT BY BUSINESS ENTERPRISES

(a) Excludes enterprises in ASIC Division A. (b) 1978-79 and 1981-82 data are classified by the 1978 edition of ASIC; 1976-77 data are classified by the 1969 edition of ASIC. If the 1978 edition were used to classify the 1976-77 data shown here only minor differences would occur. (c) ASIC Codes 16, D, E, G-H, 61-62, J-L excluding ASIC class 8461.

Payments and Receipts for Patent Licence Fees and other Technical Know-How—Australian business enterprises have significantly supplemented their R & D efforts by either purchasing or licensing foreign or Australian technology. This activity is largely associated with trans-national firms. The ABS has estimated that Australian enterprises paid \$127m in 1981-82 for patent licences and other technical know-how, of which \$124m was remitted overseas. In 1981-82 Australian business enterprises received \$17m from the sale of patent licences and other technical know-how; \$12m of this was received from overseas sources.

General Government Sector. The estimate of expenditure on R & D carried out in Australia by organisations in the General Government Sector during 1981-82 is \$708m at *current* prices. This represents a 51 per cent increase in expenditure compared with 1978-79. At *constant* (average 1979-80) prices, R & D expenditure is estimated to have increased by 4 per cent over the same period.

The estimate of manpower devoted to R & D carried out in Australia by general government organisations during 1981-82 is 17,683 man-years. This represents an increase of 1 per cent compared with 1978-79.

A summary of General Government R & D data for 1981-82 is shown in the tables below.

**RESEARCH AND EXPERIMENTAL DEVELOPMENT CARRIED OUT BY GENERAL GOVERNMENT ORGANISATIONS
R & D EXPENDITURE AT CURRENT AND CONSTANT PRICES
(\$m)**

<i>General government organisations</i>	<i>1976-77</i>	<i>1978-79</i>	<i>1981-82 (a)</i>
AT CURRENT PRICES

Higher Education Sector. The estimate of expenditure on R & D carried out in Australia by higher education organisations during 1981 is \$453m at *current* prices. This represents a 39 per cent increase in expenditure compared with 1978. At *constant* (average 1979-80) prices, R & D expenditure is estimated to have increased by 7 per cent over the same period.

The estimate of manpower effort devoted to R & D carried out in Australia by higher education organisations during 1981 is 18,241 years. This represents an increase of 7 per cent compared with 1981.

A summary of Higher Education R & D data for 1981 is shown in the tables below.

(a) University overhead R & D expenditure is an estimate of the R & D component of capital and current expenditures associated with academic services and general university services. See catalogue 8111.0 for further details.

Private Non-Profit Sector. The estimate of expenditure on R & D carried out in Australia by Private non-Profit organisations during 1981-82 was \$21m at *current* prices. This represents a 66 per cent increase in expenditure compared with 1978-79. At *constant* (1979-80) prices, R & D expenditure is estimated to have increased by 23 per cent over the same period.

The manpower effort devoted to R & D carried out in Australia by Private non-Profit organisations during 1981-82 was 688 man-years. This represents an increase of 26 per cent compared with 1978-79.

A summary of Private non-Profit data for 1981-82 is shown in the tables below.

Major Government Research Agencies

Information on the science and technology activities and expenditures of Commonwealth Government Ministries and their agencies is provided in the *Science and Technology Statement 1982-83*. Total science and technology expenditures projected by the Commonwealth Government in 1982-83 are shown as \$1,583m, of which \$891m was allocated to research and experimental development.

Commonwealth Scientific and Industrial Research Organization (CSIRO)

The CSIRO is the largest scientific research organization in Australia. It has a total staff of some 7,500 people located in more than 100 laboratories and field stations throughout Australia. About one-third of the staff are scientists.

It is a statutory body established by the *Science and Industry Research Act 1949*. Under the Act, CSIRO replaced the former Council for Scientific and Industrial Research, established in 1926. The Organization was restructured by amendments to the Act in 1978.

Briefly, the functions of CSIRO are:

- conduct of scientific research and application of the results;
- research training and funding;
- maintenance of measurement standards;
- publication and dissemination of scientific information.

When the Organization was first set up, its research centred on solving the problems then facing agriculture and industry. Today, its research extends not only to those areas but into others affecting every Australian—the environment, human nutrition, conservation and urban planning.

CSIRO is governed by an Executive comprising three full-time members, including the Chairman, and five part-time Members. An Advisory Council and advisory committees in each State and the Northern Territory, have members appointed to represent the range of interests in the Australian community.

The CSIRO's research is carried out in some thirty-nine divisions and several smaller units. The divisions and units are grouped into the following five Institutes.

Institute of Animal and Food Sciences: Divisions of Animal Health, Animal Production, Fisheries Research, Food Research, Human Nutrition, Tropical Animal Science, Molecular and Cellular Biology Unit, Wheat Research Unit.

Institute of Biological Resources: Divisions of Entomology, Forest Research, Horticultural Research, Centre for Irrigation Research, Water and Land Resources, Plant Industry, Soils, Tropical Crops and Pastures, Wildlife Research, Rangelands Research Unit, Laboratory for Rural Research

Institute of Energy and Earth Resources: Divisions of Applied Geomechanics, Energy Chemistry, Energy Technology, Fossil Fuels, Ground Water Research, Mineral Chemistry, Mineral Engineering, Mineral Physics, Mineralogy, Physical Technology Unit.

Institute of Industrial Technology: Divisions of Applied Organic Chemistry, Building Research, Chemical and Wood Technology, Manufacturing Technology, Protein Chemistry, Textile Industry, Textile Physics.

Institute of Physical Sciences: Divisions of Applied Physics, Atmospheric Physics, Chemical Physics, Computing Research, Environmental Mechanics, Materials Science, Mathematics and Statistics, Oceanography, Radiophysics, Australian Numerical Meteorology Research Centre.

A Bureau of Scientific Services is responsible for facilitating and promoting the transfer and utilization of technology and scientific and technical information for the benefit of Australian science, industry and the community at large, and undertaking development assistance projects with other nations.

The main role of CSIRO is to plan and execute a comprehensive program of general scientific research on behalf of the Commonwealth, except in the areas of defence, nuclear energy and clinical medicine. With these main exceptions, however, the research work of CSIRO includes all fields of the physical and biological sciences, and their applications.

The types of research undertaken range from fundamental studies through to experimental development, with the main concentration being on strategic research undertaken in the national interest.

Areas of research designated as having high priority for expansion in the 1980s are:

- Biotechnology;
- Water and soils;
- Oceanography;
- Energy;
- Plant pathology;
- Manufacturing industry.

The CSIRO budget for 1983-84 is an estimated \$332 million, most of which is provided directly by the Commonwealth Government. Of this, \$43 million is appropriated to Commonwealth departments (e.g. Transport and Construction) on behalf of CSIRO for capital expenditure. Some \$30 million is contributed by trust funds concerned with the wool, meat, wheat, dairying, fishing and dried fruit industries, by individual companies, by Australian and overseas government instrumentalities, and by private foundations. The trust funds constitute about half of these contributory funds and are derived mainly from industry levies but there is also a Commonwealth Government component.

Australian Government Analytical Laboratories (AGAL)

See entry on page 645.

Antarctic Division, Department of Science and Technology

Australia has been active in research and exploration in the Antarctic region since early this century, but the overall effort has expanded appreciably since the 1940s when the Government established the Australian National Antarctic Research Expeditions (ANARE) co-ordinated by the Antarctic Division of the Department of Science and Technology.

The Antarctic Division formulates and develops Australia's policies on Antarctic matters consistent with Government objectives; administers the Australian Antarctic Territory and the sub-Antarctic islands under Australian jurisdiction; organises and provides logistic support for the ANARE, including establishment and maintenance of the Antarctic stations at Casey, Davis and Mawson and the sub-Antarctic station at Macquarie Island; and plans and conducts scientific programs approved by the Antarctic Research Policy Advisory Committee (ARPAC).

The Australian Antarctic scientific program encompasses research in marine and terrestrial biology, oceanography, earth sciences, glaciology, cosmic ray and upper atmosphere physics, meteorology, bathymetry, medical research, surveying and mapping. Each year, the Antarctic Division, universities and private and public research organisations are invited to submit research proposals to ARPAC.

Australia is a signatory to the Antarctic Treaty, and many of its scientific activities in Antarctica are undertaken in collaboration with other signatory countries.

Bureau of Meteorology

See entry on page 645.

Australian Institute of Marine Science (AIMS)

The AIMS is located on a 190 hectare site within a national park at Cape Ferguson, 50 kilometres south of Townsville in North Queensland. Comprehensive facilities include laboratories, lecture

theatre, library, computer centre, administrative and other support services, a harbour and an ocean-going research vessel.

The Institute's main function is to undertake research; in this regard its activities focus on contributing to an understanding of the tropical marine environment and its associated living communities. Attention is currently concentrated on coral reef and mangrove ecosystems. A multidisciplinary approach is taken to investigate the character of these systems and the manner in which their productivity, diversity, stability and other essential attributes are affected by environment, adaptation and ecological interactions. A significant proportion of the Institute's investigations is undertaken by external collaboration, with an active visiting investigator program being an important means of achieving that objective. The interests of the research staff are necessarily diverse and include physical oceanography, marine chemistry and various aspects of biology, from biochemistry to trophodynamic ecology.

Defence Science and Technology Organisation (DSTO)

The DSTO, part of the Department of Defence, conducts a significant amount of research and development, mainly in engineering and the physical sciences. Current expenditure is about \$144 million per year. Further details on the work of the organisation, and its ten research and testing establishments are found in Chapter 4, Defence.

Australian Atomic Energy Commission (AAEC)

For information on the AAEC see Chapter 18, Energy.

Engineering Division, Department of Housing and Construction

To support its operations as the major design and construction authority for the Commonwealth, the Department of Housing and Construction carries out applied research and laboratory testing and provides a comprehensive range of technical services. In many cases, these services directly or indirectly benefit the needs of private industry and the public.

Research and special testing is conducted mainly by the Engineering Division at establishments such as the Experimental Building Station in Sydney, which specialises in building and building components, and the Central Investigation and Research Laboratory in Melbourne, which specialises in engineering materials and products.

Ionospheric Prediction Service

See entry on page 646.

Telecom Australia Research Laboratories

Telecom Australia maintains significant facilities and a staff of approximately 500 for the performance of research and development in telecommunications science and technology.

The primary objective of Telecom's research and development is to evaluate world advances in telecommunications services and systems so that it can select those best suited to the Australian environment. It also applies its research and development facilities to the solution of technical problems arising in the operation of the Australian telecommunications network. Its research and development is co-ordinated with that of industry and academia involved in telecommunications; Telecom supports their efforts with R & D contracts and grants made through the Australian Computer Research Board and the Radio Research Board.

Research in Universities and Colleges of Advanced Education

The Commonwealth Government is the primary source of funding for research activities in universities. Over half of Commonwealth funding is provided under the *States Grants (Tertiary Education Assistance) Act* which is administered by the Commonwealth Tertiary Education Commission. The general recurrent grants received by universities incorporate funding for research purposes. In addition, special research grants are available for young members of academic staff to develop their research activities, the training of research workers and post-doctoral fellowships.

In 1981 ten Commonwealth Special Research Centres were established in universities under the Commonwealth Program for the Promotion of Excellence in Research. The Government is providing \$16m for the Centres over the 1982-84 triennium.

Colleges of advanced education do not receive special funding for research purposes under the *States Grants (Tertiary Education Assistance) Act*, however, individual members of academic staff are encouraged to seek support for applied research.

The two principal grants schemes through which supplementary funds are made available for research in universities are the Australian Research Grants Scheme (ARGS), administered by the Queen Elizabeth II Fellowships and Australian Research Grants Committee (QEFARGC), and the scheme

administered by the National Health and Medical Research Council (NH&MRC). For both schemes, the principal criterion for awards is the scientific excellence of the research project. In the case of NH&MRC, the quality of scholarship is also an important criterion. NH&MRC applications are judged by expert advisory committees composed of practising scientists, and recommendations are made to the Minister for Health. ARGS applications are assessed by external assessors whose reports are considered by QEFARGC before recommendation to the Minister for Science and Technology. The Commonwealth Department of Health administers the Health Service Research and Development Grant program which provides grants to researchers in educational and health institutions and to independent researchers. The Department receives advice from the Health Services Research and Development Grants Advisory Committee.

Fellowships such as the Queen Elizabeth II and Queen's Fellowships while providing some additional funds, are significant more for the prestige they carry than for their contribution to overall funding levels. Their goal is to provide special opportunities to the very best of the younger researchers.

Research Organisations Associated with Education Institutions

In recent years there has been an increase in outside support for research in universities and colleges of advanced education. One source has been research contracts for specific projects from government and industry.

A number of the tertiary education institutions have established independent, commercial companies to promote and manage research and consultancy services to industry, commerce, government and the community. Examples are: Unisearch Ltd, associated with the University of New South Wales; ANUTECH Pty Ltd, associated with the Australian National University; Wait-Aid Ltd, associated with the Western Australian Institute of Technology; Technisearch Ltd, associated with the Royal Melbourne Institute of Technology; SAARD, associated with the Swinburne Institute of Technology; Techsearch Inc., associated with the South Australian Institute of Technology; and The University of Newcastle Research Association.

These organisations play an important role in promoting communication between the Higher Education and other sectors. They undertake investigational and research projects and provide consultancy, technical information and testing services in a range of fields including engineering, management, marketing and the social sciences.

Social Science and Humanities Research

Research in the social sciences and humanities is undertaken primarily in universities (\$137 million out of an Australian total of \$162 million for 1981-82). Support for this research comes both from general funds, provided to the universities and from specific granting schemes such as the ARGS.

The bulk of the social science and humanities research carried out within Commonwealth Government agencies is performed as part of the general activities of various departments. In addition, several other Commonwealth Government agencies have an active interest in either sponsoring or undertaking such research. These include the Australian Institute of Aboriginal Studies, the Australian Institute of Criminology, the Bureau of Industry Economics, the Bureau of Agricultural Economics, the Bureau of Transport Economics, the Bureau of Labour Market Research, the Institute of Family Studies and the Australian Institute of Multicultural Affairs.

Agencies of the various State governments undertake research relevant to their own activities. A number of research organisations in the transport sphere are funded from both Commonwealth and State sources. The Australian Road Research Board and the Australian Railway Research and Development Organisation are active in social science research.

Exchange of ideas and information on the social sciences is promoted through a number of professional and learned bodies, of which the Australian and New Zealand Association for the Advancement of Science and the Academy of Social Sciences in Australia are the most broadly based. In addition to encouraging the advancement of the social sciences, the Academy sponsors and organises research, subsidises publications and acts as a consultant and advisor in the social sciences field.

Non-government bodies which undertake or promote research in specific fields of the social sciences include the Australian Institute of International Affairs, the Australian Institute of Urban Studies, and the Australian Institute of Political Science.

International Activities

International Organisations

Australia participates in a range of programs and projects of United Nations and other organisations (UNESCO, OECD, United Nations Economic Program, World Meteorological Organisation, World Intellectual Property Organisation and International Atomic Energy Association) and in the

activities of both governmental and non-governmental scientific organisations. To facilitate scientific liaison and representation, the Commonwealth Government has scientific representation at some overseas posts (Tokyo, Paris (OECD)). In November 1982, Australia was elected a member of the Inter-governmental Oceanographic Commission Executive Council. Australia also participates in regional collaborative programs organised by the Economic and Social Commission for Asia and the Pacific, the Association for Science Co-operation in Asia, the Commonwealth Science Council and the Pacific Science Association. Technical assistance is provided for countries in the region under both multilateral and bilateral arrangements.

Participation in international non-governmental scientific bodies is arranged through learned and professional bodies. For example, the Australian Academy of Science provides representation to the International Council of Scientific Unions (ICSU) and a number of its affiliated bodies.

Antarctic Treaty and Conservation of Antarctic Marine Living Resources

In 1957, as part of the International Geophysical Year (IGY), twelve nations including Australia co-operated in research programs in Antarctica. The outstanding co-operation between nations in the Antarctic during the IGY resulted in discussions which culminated in the establishment of the Antarctic Treaty. It was signed on 1 December 1959 by the nations that had been active in Antarctica during the IGY, including all of those with territorial claims. The original signatories were Argentina, Australia, Chile, France, New Zealand, Norway, UK (all claimants), Belgium, Japan, South Africa, the USSR and the USA (all non-claimants). The Treaty, which was ratified by Australia in 1961, among other things reserves the Antarctic area south of 60°S latitude for peaceful purposes, provides for international co-operation in scientific investigations and research, and preserves for the duration of the Treaty the legal positions of claimants and non-claimants with regard to territorial sovereignty, rights and claims.

The Treaty makes provision for other states to accede to it. Sixteen nations have acceded: Poland, German Democratic Republic, Czechoslovakia, Romania, Denmark, the Netherlands, the Federal Republic of Germany, Papua New Guinea, Peru, Italy, Uruguay, Bulgaria, China, Brazil, India and Spain. Poland and the Federal Republic of Germany have been accorded consultative status.

Australia hosted the first Antarctic Treaty Consultative Meeting in July 1961 and the twelfth in September 1983. Observers from the contracting parties to the Treaty, which are not also consultative parties, were invited for the first time to the twelfth meeting held in Canberra in September 1983.

The consultative parties have formulated a number of measures to protect Antarctica's fragile ecosystem. The environment of the Australian Antarctic Territory is protected by the *Antarctic Treaty (Environment Protection) Act 1980*, and by recommendations of Treaty meetings that the Australian Government has adopted.

Australia is also participating in meetings to negotiate a regime to regulate exploration for and exploitation of Antarctic minerals. The first meeting was held in Wellington, New Zealand, in June 1982. The most recent meeting was in Bonn, West Germany, in July 1983.

At a diplomatic conference in Canberra in May 1980 the Treaty consultative partners adopted the Convention for the Conservation of Antarctic Marine Living Resources (CCAMLR). The Convention establishes the basis for a conservation and management regime for the entire ecosystem of the area south of the Antarctic Convergence (about 45° to 56°S). The headquarters of the CCAMLR Commission, established under the Convention, is in Hobart. Fifteen nations and the European Community have signed the Convention which is open to accession by any country. Australia was elected to provide the first Chairman of the Commission, and an Australian has been appointed as first Executive Secretary.

Studentships and Fellowships

Australia has assisted other countries, principally in the Asian and Pacific regions, by training their nationals. Large numbers of such students, mainly seeking first qualifications at tertiary level, have been accommodated under schemes such as the Colombo Plan. There are also arrangements under which established scientists from overseas are assisted to undertake study and research in Australia.

Bilateral Arrangements

Various bilateral arrangements at both government and non-government levels have contributed to the development and maintenance of co-operation in science and technology between Australian institutions and scientists and those in other countries. Formal bilateral agreements, administered by the Department of Science and Technology, reflect two major aspects: the importance of a regular flow of scientific and technological information into Australia; and the significance of Australian science, technology and industrial property systems in assisting the economic growth of less developed countries. These agreements, solely devoted to scientific and technological co-operation, have been entered into

with the USA (1968), India (1975), the USSR (1975), the Federal Republic of Germany (1976), Japan (1980), the Peoples Republic of China (1980) and Mexico (1981). Support is provided for both individual visits and specialist seminars over the whole range of civil science. Where opportunities exist, other co-operative projects which depend on special facilities are supported.

A scientific exchange program between the Australian Academy of Science and the Academia Sinica of Beijing was initiated in 1977. Scientific fields considered most promising are plant physiology, entomology, earth science and radio astronomy.

Visits to Japan and China by Australian scientists can be supported by the Australia/Japan Foundation and the Australia/China Council respectively.

Meteorology

Australia is a member of the World Meteorological Organisation (WMO), with the Director of Meteorology being Australia's Permanent Representative on WMO.

Optical Astronomy

The Anglo-Australian Telescope Board was established under the provisions of an international agreement between Australia and the United Kingdom and draws its funds in equal shares from each country. It operates the 3.9 metre Anglo-Australian Telescope at Siding Spring Mountain near Coonabarabran in New South Wales; the Telescope is among the largest in the world and came into full scientific operation during 1975. Its technical excellence and the scientific work which it has made possible have made it widely recognised as one of the world's foremost optical telescopes.

Space

An agreement by the Governments of Australia and the USA to co-operate in the establishment and operation in Australia of space vehicle tracking stations was signed in 1960 and has been renewed since then at ten-year intervals. The agencies for the Australian and US Governments are the Department of Science and Technology and the National Aeronautics and Space Administration (NASA) respectively.

As part of the world-wide network supporting NASA's space program, the Australian stations track spacecraft in their orbits around the earth or on their journeys into space, receive telemetered data from the spacecraft, and relay radio commands controlling the spacecraft.

The Department of Science and Technology is responsible for managing, staffing and operating the tracking stations on behalf of NASA. The stations are located at Orroral Valley and Tidbinbilla in the Australian Capital Territory and at Yarragadee in Western Australia. A communications system links them with control centres in the US.

Expenditure by NASA on its tracking station operations in Australia in 1982-83 was about \$12 million.

An agreement was signed in 1979 between the Commonwealth Government and the European Space Agency (ESA) for the establishment and operation of a space vehicle tracking facility in Australia in support of ESA programs. The facility is located at the site of the Overseas Telecommunications Commission (Aust.) earth Station at Carnarvon, W.A. Arrangements have been made with ESA for CSIRO's Parks radio telescope to be used to support ESA's Giotto spacecraft which will try to intercept Halley's Comet in March 1986.

Seismology

A comprehensive seismic station at Alice Springs (Joint Geological and Geophysical Research Station) is operated jointly under an agreement between the Governments of Australia and the United States of America. The agencies for the Governments are, respectively, the Department of Science and Technology and the United States Air Force.

The station provides continuous seismic records to assist the United States Government in the identification of underground nuclear explosions and, through the Department of Science and Technology, provides seismic records to the Bureau of Mineral Resources. Records are also available, through the Department of Science and Technology, to Australian scientists for research in earth physics.

Defence

In the field of defence science, Australia collaborates with other countries through a variety of arrangements at intergovernmental level. Further information including defence science technology arrangements is given in Chapter 4, Defence.

Transport

Through a variety of arrangements at intergovernmental level, Australia is represented at Federal and State levels in a number of international organisations concerned with transport research. Further information is given in Chapter 20, Transport and Communications.

Other

At the non-governmental level, formal arrangements for scientific co-operation with counterpart institutions in other countries have been concluded by a number of Australian bodies. For example, an arrangement covering co-operation in astronomy exists between the University of Sydney and Cornell University (USA), while over a broader area the Australian National University has an arrangement with the University of Moscow which includes exchanges in the scientific fields.

Additional information

Additional information on topics presented in this chapter may be found in the annual reports of the organisations mentioned, particularly the Department of Science and Technology, the CSIRO and its divisions, the Australian Atomic Energy Commission and the Department of Defence and in the annual *Science and Technology Statements*. Statistical information for the years 1968-69, 1973-74 and 1976-77 may be found in the reports published by the Department of Science and Technology on Project SCORE. Statistical information relating to 1978-79 and to 1981-82 may be obtained from the Australian Bureau of Statistics (ABS). See paragraphs on expenditure and human resources devoted to Research and Experimental Development (in this chapter) for details of ABS publications.

Recent information on manufacturing industry research and development is contained in ASTEC's report on *Industrial Research and Development: Proposals for Additional Incentives*, June 1980 and the report of the Industries Assistance Commission, *Inquiry into Certain Budgetary Assistance to Industry*, March 1982. In addition, information is contained in the annual reports of the Australian Industrial Research and Development Incentives Board. For reports published prior to 1980 see previous editions of the Year Book.
