## Page No.

1. General Review of Food Production, Exports and Apparent Consumption
(i) Summary
(ii) Wheat
(iii) Sugar
(iv) Milk 6
(v) Beef and Veal 7
(vi) Mutton and Lamb 8
(vii) Other Food Products 9
(viii) Consumption of Foodstuffs 9
2. Level of Nutrient Intake 11
3. Production, Distribution and Apparent Consumption of Individual Commodities -
(i) Milk and Milk Products (excluding Butter) 18
(ii) Meat
(iii) Poultry, Game and Fish $\quad 27$
(iv) Eggs and Egg Products 28
(v) Oils and Fats (including Butter) 30
(vi) Sugar and Syrups $\quad 32$
(vii) Potatoes (White and Sweet) 34
(viii) Pulse and Nuts $\quad 36$
(ix) Tomatoes and Citrus Fruit 37
(x) Fruit and Fruit Products (excl. Tomatoes and Citrus Fruit) 38
(xi) Vegetables - Leafy, Green and Yellow . 41
(xii) Vegetables - Other $\quad 43$
$\begin{array}{ll}\text { (xiii) Grain Products } & 43 \\ \text { (xiv) Beverages } & 46\end{array}$
4. Detailed Statistical Data showing Estimated Supplies and Utilization of Foodstuffs - Year ended June, 1958.

GRAPHS
Indexes of Quantum of Production, Exports and Consumption
of Farm Products for Food Use : Australia
Source of Calories in the Australian Diet, 1957-58 14
Milk : Production and Utilization, 1957-58 19
Meat : Production and Utilization 25
Raw Sugar : Supplies and Utilization 33
Fruit : Supplies and Utilization 39

This Bulletin continues the series of Reports on the production and consumption of $\hat{\text { Codstuffs }}$ and mutrients published annually since the issue made in 1948, which covered the years 1944 to $1946-47$, with prewar comparisons. The statistics published in this Bulletin, No. 13 of the series, refer to the year 1957-58 together with comparative data for the average of the three pre-war years 1936-37 to 1938-39, the average of the three immediate post-war years 1946-47 to 1948-49, and each of the years 1955-56 and 1956-57.

In addition to these general statistics, Section I of the Bulletin contains a review of food production, exports, and consumption (in terms of farm products), with relevant statistics for the pre-wax period (1936-37 to 1938-39), each year 1949-50 to 1957-58 and estimates for 1958-59.

Wherever possible the method employed in this Bulletin in estimating consumption of each of the various foodstuffs is as follows:-

Production<br>Minus - Exports Ships' Stores Industrial Usage Noz-food Usage Wastage<br>Plus - Imports<br>Plus or Minus - Changes in factory or in-store (a) stocks<br>= Apparent Consumption

(a) In-store stocks in general consist of the stocks reported by marketing authorities although for various reasons, such as incomplete coverage, adequate iniormation is not available from all marketing authorities in Australia.

There are three significant features about this calculation.

1. Available production statistics are confined mainly to commercial production and are deficient for the purposes of the calculation to the extent of production by householders for theix own use. This applies particularly in the case of vegetables, fruit, eggs, poultry and fish. In all these cases, however, estimates of non-commercial production have been included, based on somewhat inadequate information obtained from a household expenditure survey conducted in 1944 and other investigations conducted by government departments during the war. Similarly, in the case of processed foods, little up-to-date information is available of the quantities of foodstuffs preserved by householders for their own use. To cover this, estimates have been made on the basis of information collected during the war. Further, it is possible that there has been some increase in home production of both processed and unprocessed foods in recent years so that the quantities of foodstuffs consumed as shown in the Bulletin may now be deficient to the extent of the increase.
2. Statistics of stocks refer to in-store (as previously defined) and factory stocks. No details are available of wholesalers', retailers' or householders' stocks. For perishable commodities this point is of little importance since the very nature of the commodity precludes the accumalation of stocks. This is not the case, however, with non-perishable foods, and estimates derived for consumption of such foodstufis for individual years may not correctly state the position with regard to consumption as ordinarily understood, ioe. foodstuffs consumed by the individual. This difficulty is apparent particularly in the case of canned foodstuffs where in some years it has been necessary to initiate special enouiries from the trade and other informed sourees in an endeavour to take better account of these deficiencies.
3. In many cases, allowance is not made for wastage before the foodstuffs are consumed. The importance of this factor is difficult to estimate but, since, in some seasons, gluts cause considerable destruction of perishable foodstuffs, it should be taken into account when using these statistics. The effect of ignoring wastage is ultinately to overstate the consumption figures. In recent Jears, however, it is likely that there has been less wastage of foodstuffs than hitherto because of more efficient storage and distribution methods (including refrigerated transport, aim freight and a big increase in household refrigeration).

As a result of the last two of the above qualifications，the term ＂consumption＂is used in a specialised sense since the quantities actually measured are broadly the quantities available for consumption at a particular level in the process of distribution i．e．exmarkets，ex－store or ex－factory depending on the method of marketing and／or processing．It is thought that in most cases these foodstuffs will find their way to the ultimate individual consumers with little or no time lag and the collected figures accurately represent total consumption in the year to which they relate．In a few cases，the annual figures on this basis required some adjustment and the commodities to which adjustments have been considered necessary are referred to specifically throughout the text．

There is one further point which should be borne in mind when comparing estimates of consumption（and particularly estimates of consumption per head of population）over a number of years．This is the effect of changes in the composition of the population．There have been two significant changes in post－war Jears which have undoubtedly had some effect on the consumption pattern．These are， firstly，the changing age distribution of the population（eogo the namber of children under 10 years in 1947 represented 18.0 per cent．of the total population while in 1954 they represented 20.8 per cent．）and，secondly，the increasing proportion of the population born overseas and resident for only a comparatively short period in Australia（e．go the proportion of the population in 1947 which was born overseas was 904 per cent．and in 1954 it was 13.8 per cent。）。

In general the statistics in the bulletin are for fiscal years．However， where there is a marked seasonal pattern in the production or marketing of certain crops，the statistics refer to crop yearso For example，statistics relating to potatoes and dried vine fruits are on the basis of years ending in October and December respectively．

Section 2 of this Bulletin，which deals with the level of nutrient intake in Australia，has been compiled by officers of the Nutrition Section of the Commonwealth Department of Health，to whom I extend ny thanks．The estimates of mutrient intake，which are calculated annually to provide a continuing review of the dietary status of the population，are based on the quantities of foodstuffs consumed as calculated by this Bureau．While these estimates are in terms of Commonwealth averages and do not，therefore，provide information regarding the dietary status of individuals or of specific groups within the population，they supply a valuable indication of overall trends and enable comparisons with other data（e．g．special surveys）within Australia and with data for other countries．Studies are made from time to time by the Nutrition Committee of the National Health and Medical Research Council and by various other health authorities in Australia to determine the adequacy of nutrients in the diet of the population as a whole or of various sections of the population。 As a result of such studies，recommendations may be made for vaxying the diet to counteract arry deficiencies revealed eogo the free distribution of milk to raise the calcium intake of school children．

## COMMONWEALTH BUREAU OF GENSUS AND STATISTICS

1. GENERAL REVIEW OF FOOD PRODUCTION, EXPORTS AND APPARENT CONSUMPTION
(i) SUMMARY: The following table shows the tariations which have occurred in post-war years in the main sources from which farm products for food use are derived in Australia.

TABLE I : PRINCIPAL AREAS CROPPED AND LIVESTOCK NUMBERS : AUSTRALIA

| Year | Areas sown for Grain |  |  | Sugar (Area cut for crushing) | Total Area of Crops | Number of Livestock at end of Season |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Wheat | Barley | Oats |  |  | Sheep <br> (incl. <br> Lambs) | Cattle |  |
|  |  |  |  |  |  |  | Dairy <br> Gows <br> (a) | Other Cattle |
|  | 1000 | ${ }^{1} 000$ | 1000 | ${ }^{1} 000$ | ${ }^{9} 000$ | million | ${ }^{\prime} 000$ | 1000 |
|  | acres | acres | acres | acres | acres | million | 000 | 000 |
| Average 1936-37 to 1938-39 | 13,466 | 613 | 1,572 | 258.1 | 22,018 | 111.6 | 3,210 | 9,933 |
| 1949-50 | 12,240 | 1,040 | 1.748 | 281.3 | 20,514 | 112.9 | 3,191 | 11,449 |
| 1950-51 | 11,663 | 1,079 | 1.757 | 271.9 | 19,811 | 115.6 | 3,197 | 12,032 |
| 1951-52 | 10,384 | 1,118 | 2,365 | 281.7 | 19,683 | 117.6 | 3,019 | 11,874 |
| 1952-53 | 10,209 | 1,377 | 2,764 | 280.0 | 20,251 | 123.1 | 3,134 | 12,113 |
| 1953-54 | 10,751 | 1,803 | 2,137 | 340.5 | 21,013 | 126.9 | 3,259 | 12,343 |
| 1954-55 | 10,673 | 1,691 | 2,574 | 374.2 | 21,695 | 130.8 | 3,282 | 12,554 |
| 1955-56 | 10,166 | 1,894 | 3,354 | 372.8 | 22,454 | 139.1 | 3,403 | 13,054 |
| 1956-57 | 7,874 | 2,093 | 2,556 | 370.1 | 19,401 | 149.8 | 3,451 | 13,806 |
| 1957-58 | 8,848 | 2,121 | 2,959 | 375.7 | 21,471 | 149.3 | 3,362 | 13,530 |
| 1958-59 (b) | 10,192 | 2,300 | 4,000 | 376.0 | (c) | 152.7 | 3,283 | 12,996 |

(a) In milk and dry.
(b) Estimated.
(c) Not yet available.

Generally adverse seasonal conditions prevailed during 1957-58 over those areas of Australia devoted to agricultural and pastoral production. Die to the reduced sowings and the low average yield, both resulting from the dry conditions experienced during the year, the wheat harvest in 1957-58 was the lowest since 1944-45. Although approximately normal acreages of barley and oats were sown the low average yields obtained reflect the result of moisture deficiency.

Pastures deteriorated during 1957-58 and hand feeding of stock was necessary in many areas. Although the number of cattle slaughtered was higher than in 1956-57 the production of beef and veal fell in 1957-58 due to the lower average carcass weight. Production of mutton and lamb rose in comparison with the previous year, the lower average carcass weight being offset by the increased slaughterings.

Climatic conditions were mach more beneficial to rural industry during the 1958-59 season, and this is reflected in the production figures. Production of wheat, estimated at 213.7 million bushels was the highest since 1949-50. Barley production ( 59.5 million bushels) was approximately 10 million bushels in excess of the previous record of 1956-57 while estimated oat production ( 72.0 million bushels) exceeded the $1956-57$ record by approximately 15.5 million bushels. Dairy production increased by approximately 7 per cent. in comparison with the previous year while production of matton and lamb and beef and veal both established new records. Production of sugar cane was also the trighest ever recorded.

At the close of the year stock and pastures were generally in good condition and agricultural operations had proceeded uninterrupted by unfavourable weather. Dry conditions which had been causing anxiety in some areas of Victoria, Western Australia and Tasmania were relieved by general late Autumn and Winter rainfall.

The index of production of farm procucts for food uise in 195859 is estimated to have been at the record level of 44 per cent. above the pre-war years. The previous highest level achieved was in $1955-56$ when the index was 29 per cent. above the prewar years. A sharp increase was recorded compared with the previous year, 1957-58, when the index was at the lowest level (14 per cent. above pre-war) since 1951-52, both of these years being affected by very dry conditions.

The index of farm production of food per head of population has been below the prewar level since 1947-48. After falling to its lowest point of 20 per cent. below the average for the pre-war years in $1957-58$ it is estimated to have risen in 1958-59 to almost the pre-war level (1 per cent. below).

This comparison is intended to indicate relative growth of total Australian population and of farm production for food use．It is not relevant to the consideration of productivity of farm population．

The index of farm products for food use exported in 1958－59 is estimated to have been 28 per cent，above the average for the three years 1936 m 37 to 1938－39。 The level reached in 1958－59 represented a considerable increase in comparison with the previous year when the index was 9 per cent．below the prewar average and has been exceeded only by the record high level of 1955－56（31 per cent．above pre－war）． The index of farm products exported per head of population has been below pre－war levels in all years under review．In 1957－58 it was 64 per cent．and in 1958－59 was estimated at 88 per cent．of the pre－war figure。

## The index numbers of food（in terms of farm products）consumed＊in

 Australia per head of population indicate that the level of food consumed per head in each of the years 1949－50 to 1958－59 has been somewhat below the level of consumption in the prewar period 1936－37 to 1938－39．Certain adjustments have been made for unrecorded stock movements in calculating the index numbers for some years，and the figures for 1957－58 and 1958－59 should be regarded as provisional．While there has been a slight decrease in the quantity of food available for consumption per head it is possible that this may have been offset in part at least by reduced wastage before ultimate consumption within the home．Factors conducive to this are more efficient distribution methods（e．go refrigerated transport and airfreight of perishable commodities）and the large increase in household refrigeration．In addition there has possibly been increased home production of vegetables，fruit and eggs．It is extremely difficult to gauge this trend and the calculations in this Bulletin contain a constant allowance for supplies from home production．While there has been a slight downward tendency in consumption of food per head，the increase in the Australian population has resulted in a contimuous rise （except in 1951－52 and 1952－53）in the index of total consumption of food in Australid in each post－war year and in 1958－59 it is estimated at 42 per cento greater than in the pre－war period．The increase in population over the same period was approximately 45 per cent．

The quantum indexes shown in Table 2 are indexes of total value at constant prices calculated by revaluing quantities of each farm product included in the indexes at the average unit gross value of each product for the years 1936－37 to 1938－39。

Tests have disclosed that the use of corresponding weights based on post－war prices（or unit values）would not have affected the indexes materiallyo The items included in each index comprise products in the form in which they are sold from farms in all cases except livestock sold for slaughter for meat，which are inciuded in terms of dressed carcass weight of meat．Quantity data relating to exports include exports of processed food in terms of farm product equivalent，eogo the quantities of meat exports used in calculating the index include estimated carcass weight equivalents of canned and cured meat exported in addition to the exports of carcass meat as such． The index of production relates basically to gross output of farm products for food use（including crops exported for stock－feeding overseas）and therefore measures the combined effect of many influences such as（a）trends in farming activity（ioe．areas cropped，livestock raised and／or slaughtered，cows milked etc。），（b）variations in yields of crops per unit of area cropped and of livestock products per unit of livestock，（c）the effects of variable seasonal conditions and（d）changes in farming efficiency，labour supply and the level of internal costs in Australia．Data showing trends in farming activity in the case of principal individual types of farming are included in the sub－sections following．

[^0]

| United Kingdom | 100 | 145 | 146 | 150 | 156 | (d) |
| United States of America | 100 |  |  |  |  |  |

(a) Pre-war base periods used are: Australia, Average 1936-37 to 1938-39。

United Kingdom, Average 1934-38; other countries, Average 1935-39.
(b) Preliminary figures. (c) These are the index numbers of quantum (i.e. value at constant prices) compiled in this Bureau for Australian purposes (see Table 2), due to a different method of compilation they differ slightly from the index numbers for Australia compiled by F.A.O. (d) Not yet available.
(ii) WHEAT: Particulars of the area sown to wheat for grain and the production, exports and consumption of wheat are shown below for the pre-war period and each year since 1949-50. The area sown for grain declined continuously from 1947-48 to 1956-57 with the exception of the two years 1953-54 and 1954-55 when there was a small recorery.

In 1956-57, sowings were the lowest for 43 years and although a considerable increase occurred in 1957-58 the area sown in that year was still 34 per per cent. below the average for the three years 1936-37 to 1938-39. A further increase of 15 per cent. in comparison with the previous year took place in 1958-59 but sowings were still 24 per cent. below the average for the three pre-war years. The generally lower sowings since the war have been offset by very high average yields, every year except 1957-58 having been in excess of 15 bushels per acre compared with an average of about 12 bushels pre-war. Consequently, production up to 1955-56 remained at the high level of about 200 million bushels. Production fell in 1956-57 to 135 million bushels and again in 1957-58 to 98 million bushels, the lowest recorded since 1944-45. In 1958-59 however, the increased acreage and high average yields resulted in a harvest of 214 million bushels, the highest since 1949-50.

In 1957－58（cereal year ended 30th November，1958），exports of wheat （including wheat equivalent of flour and breakfast foods），amounted to only 53 million bushels．This was approximately half the recorded exports in the previous year and the pre－war average．The available supply of wheat（including wheat equivalent of flour）for export in 1958－59 amounted to about 141 million bushels after allowing for 20 million bushels as normal carry－over．

The wheat equivalent of flour and wheaten breakfast foods consumed in Australia rose at approximately the same rate as the Australian population until 1957－58 when the steady increase was interrupted．In 1958－59 it is estimated to have exceeded pre－war consumption by 35 per cent．Considerably larger quantities of wheat have been fed to stock in Australia in recent years than before the war．

TABLE L WHEAT ：AREA SOWN，PRODUCTION，EXPORTS AND COMSUMPTION ：AUSTRALIA
（Base of Indexes－Average 1936－37 to 1938－39＝100）

| 1958－59（d） | 10，192 | 76 | 213.7 | 130 | （e） | （e） | 41.7 | 135 | 93 |

（a）Includes quantities used for stock－feeding and for seed．（b）Includes exports of flour and breakfast foods in terms of wheat．（c）Flour and breakfast foods． （d）Estimated。（e）Not yet available．
（iii）SUGAR：Following reductions during the war years，the area of sugar cane cut for crushing increased to 374,200 acres by 1954．In both 1955 and 1956，slight reductions in area were recorded but it is estimated that in 1958 the acreage increased to 376，400．

Production has also increased during the post－war period，the peak figure of $1,327,500$ tons in terms of 94 net titre being recorded in 1954－55．Some reduction in production occurred in years following 1954－55 but the estimated output of $1,409,900$ tons for $1958-59$ created a new record．

Exports of sugar（including sugar exported in manufactured products）have varied considerably since the war，the lowest being 215， 200 tons in 1951－52． Estimated exports in 1958－59 reached the record high level of 829,300 tons．

Sugar consumption per head has been consistently higher than in the pre－war period and reached a peak of 14 per cent。above the prewar level in 1950－51． In recent years consumption per head has been somewhat lower and in 1958－59 is estimated at 7 per cent。 above pre－war．

Particulars of the area of sugar cane cut for crushing, and the production, exports and consumption of raw sugar are show in the table below.

## TABLE 5: RAW SUGAR : AREA CUT FOR CRUSHING. AND PRODUCTION, EXPORTS AND APPARENT CONSUMPTION : AUSTRALIA

(Base of Index Numbers - Average 1936-37 to 1938-39 = 100)

| Year | Area of Sugar Cane Cut for Crushing |  | Production of Raw Sugar <br> (94 net titre) |  | Exports of Sugar (a) |  | Apparent Consumption of Sugar (a) |  |  |

(a) Raw and refined sugar and sugar in manufactured products all in terms of raw sugar (94 net titre). (b) Subject to revision. (c) Estimated.
(iv) MILK: The number of dairy cows (in milk and dry) rose continuously from the low war-time levels until March, 1951, when the total was 3,197,000. In March, 1952, when some major dairying districts were affected by severe drought, the numbers were about 6 per cent. Iess than the average number for the three years ending March 1937 to 1939. In the years following 1951-52 numbers increased steadily and reached 3,451,000 in 1956-57 but in the next two years declined to 3,283,000 at March, 1959.

Production of milk, jnfluenced as it is by prevailing seasonal conditions, has shown considerable variation since the war. The lowest production ( 1,047 million gallons) was recorded in 1951-52 and the highest (1,402 million gallons) in 1955-56. Production fell in the two subsequent years but the preliminary figures for 1958-59 indicate a return to the comparatively high level of $1,344,000$ gallons.

Exports of butter, cheese and other milk products (expressed in terms of milk equivalent) fell sharply in 1951-52 to 29 per cent. of the pre-war average due to the low production mentioned above, but rose against subsequent years and, in 1955-56, exceeded the average pre-war figures for the first time since 1949-50. In 1956-57 and 1957-58, however, reduced exports were recorded and although preliminary estimates for 1958-59 show a sharp increase, a level of 17 per cent. below the pre-war period is indicated.

The apparent consumption of milk (including the milk equivalent of milk products) per head of population rose following the lifting of butter rationing in June, 1950. Since 1954-55, however, consumption per head has declined again and in 1958-59 was 3 per cent. below the pre-war average.

Relevant particulars of dairy cow numbers and production, exports and consumption of milk are shom below.

## TABLE 6: DATEY COW NUMBERS AND PRODUCTION, EXPORTS AND APPARENT <br> CONSUMPTION OF MLLK : AUSTRALIA <br> (Base of Indexes - Average 1936-37 to 1938-39 = 100)

(d) Not yet available.
(v) BEEF AND VEAL: Numbers of cattle (other than dairy cows) rose steadily in post-war years reaching a peok of $13,806,000$ in $1956-57$. thergely es e result of edverse climatic conditions numbers declined in the two years folloving end at March, 1959, stood at 12,996,000.

Beef and veal production has risen continuously(except in 1951-52 and 1957-58) and in 1958-59 reached a new peak of 892,300 tons.

Exports of beef and veal (including carcass equivalent weight of canned meat exports) have increased greatly since 1951-52 and in 1958-59 it is estimated that they were about two and a hall times the prewwar level.

Apparent consumption of beef and veal per head of population in Australia has been lower in all post-war years than in the pre-war period. In 1957-58 consumption per head was 11 per cent. below the pre-war level and in 1957-58 is estimated to have fallen further to 12 per cent. below. Owing to the increase in population, total supplies consumed exceeded pre-war consumption by an estimated 27 per cent. in 1958-59.

Particulars of cattle numbers and production ${ }_{9}$ and exports and consumption of beef and veal are shown in the following table.
(Base of Indexes - Average 1936-37 to 1938-39 = 100)

(vi) MUTTON AND LAMB: Particulars of sheep and lamb numbers and mutton and lamb production exports and apparent consumption are shown in the following table.

Numbers of sheep and lambs during the period March, 1947 to March, 1957, rose steadily from 95.7 million to 149.8 million. A slight decrease occurred during the year ended March, 1958 but numbers at March, 1959 had again increased and were estimated at 152.7 million.

Mutton and lamb production reached the comparatively high figure of 395,100 tons in 1952-53 but in subsequent years was at a reduced level. In 1957-58 and 1958-59, however, it increased substantially and in 1958-59 created a new record of 481,500 tons.

Exports of mutton and lamb (including carcass equivalent of canned meat exports) had until 1958-59 exceeded the pre-war level only in 1949-50 and 1952-53. Exports in 1958-59, however, were considerably greater than the previous year and were 15 per cent. above the average for the three years 1936-37 to 1938-39.

(a) Includes exports of canned meat in terms of carcass weight. (b) Carcass weight.
(c) Subject to revision. (d) Estimated.
(vii) OTHER FOOD PRODUCTS: Particulars of production, exports and consumption of other food products for $1957-58$ in comparison with earlier years are show in detail in later sections of this Bulletin.
(viii) CONSUMPTION OF FOODSTUFFS: Details of the apparent consumption of foodstuffs and beverages expressed in pounds per head of population per amum are shown in fourteen commodity groups in the following table for the average of the three years 1936-37 to 1938-39, the average of the three years 1946-47 to 1948-49 and for each year 1955-56 to 1957-58. Apparent consumption per head of population for several commodities during 1957-58 was slightly lower than in the previous year, these items being meat, eggs, sugar, tomatoes and citrus fruit, leafy, green and yellow vegetables and grain products. Consumption of all other commodity groups either increased or remained unchanged in 1957-58。

For details of the method of calculating consumption and the deficiencies in the various statistics see the Preface to this Bulletin.
TABLE 2: ESTTMATED SUPPLIES OF FOODSTUFFS AVAILABLE FOR CONSUMPTION - AUSTRALIA
(lb. per head per annum)

NOTE: The Analysis in this Section is based on the statistics collected by the Commonwealth Statistician as set out elsewhere in this Bulletin and is therefore subject to the same qualifications. See the Preface for a statement of these qualifications.

In order to determine whether the quantities of the various foodstuffs passing into consumption are likely to be sufficient for adequate nutrition, it is necessary to calculate the amount of nutrients the foods provide. The basis for the calculations in this section of the Bulletin have been changed since issue No. 8, and from No. 9 onwards are based on conversion factors calculated from "Tables of Composition of Australian Foods" (Anita Osmond and Winifred Wilson, Canberra, 1954). With the exception of the figures shown for vitamin $A$, which have all been revised on the new basis, the change in conversion factors does not seriously affect comparison with years prior to 1952-53, but the fact that the comparison is not entirely valid should be kept in mind.

The nutritive value of the food passing into consumption during the jear 1957-58 is shown in Table 13 following, and comparisons with previous years and with other countries in Tables 14 and 15 respectively.

In Tables 13-15 no allowances are made for losses of nutrients due to the effects of storage and cooking. Such losses may be considerable, but they are so variable that precise allowances cannot be estimated. Losses due to processing have been allowed for in the conversion factors used for processed and preserved foods.

## Recommended Dietary Allowances.

The nutritive value of the food passing into consumption may be compared with some arbitrary standard such as quantities of nutrients recommended for consumption. The Recommended Dietary Allowances for Australia formulated by the Nutrition Committee of the National Health and Medical Research Council (Medical Journal of Australia, Vol.2,P113, 1954) provide such a yardstick. It must be emphasised that these allowances do not necessarily represent nutrient requirements; rather were they devised for the planning of practical diets within the average Australian food pattern. Precise information concerning human requirements of certain nutrients is far from complete; and no conclusion regarding the nutritional status of the community should be drawn from comparisons with these recommended allowances. A deviation from the recommended allowance of the order of $10-15 \%$ is not regarded as a serious deficiency. Even if the nutrient intake is more than $15 \%$ below the recommended allowance, a nutritional deficiency cannot be assumed without clinical verification.

The calculated figures, being averages, give no information regarding the food consumption of individuals or of specific groups within the population. Also, the figures represent foods available for consumption, which is not strictly the same as food consumed. The Food and Agriculture Organization of the United Nations estimates that up to $15 \%$ of food available may be wasted in communities with a plentiful food supply.

With these reservations, the nutrients available for consumption are compared in Table 12 with the recommended allowances. The recommended allowances are averages weighted according to the various age groups in the population.... Such a comparison is useful as an indication of trends in food consumption even though no inferences of nutritional deficiency are valid.

## Losses of Nutrients

As a result of storage and cooking, certain foods, particularly fruit and vegetables, could lose some of their nutritive value. An estimate of possible losses of thiamine and ascorbic acid (Vitamin C) in cooking has been made and the factors applied to the nutrients available for consumption. Losses of other nutrients do occur but not in amounts that are likely to be significant. Losses due to storage have not been estimated.

Losses of vitamin Cover a wide range, from almost nil to 100\%. The estimates given in the following two tables are applicable to average conditions and methods, but losses could be reduced to less than these figures by careful cooking.

| Food | Estimated average loss <br> of Vitamin C in cooking |
| :--- | :---: |
| Leafy Green Vegetables | $60 \%$ |
| Potatoes | $50 \%$ (Cooked in skin, neglibible <br> (loss) <br> (Boiled and mashed, $60 \%$ or <br> more) |
| Sther Vegetables | $50 \%$ |

Losses from tomatoes, citrus fruit and other uncooked fruits and vegetables are assumed to be neglibible while losses in canning and drying of fruit and vegetables have already been accounted for in the calculations made for the figures in Table 13.

TABLE 11: ESTIMATED VITAMIN C AVAILABLE AFTER ALLOWANCE FOR COOKING LOSSES. 1957-58
(Milligrammes Per Head per Day)

| Food | Calculated Value <br> (See Table No. 13) | Amount Available |
| :--- | :---: | :---: |
| Milk | 4 | $(\mathrm{a})$ |
| Meat | 2 | (a) |
| Tomatoes and Citrus Fruit | 22 | 22 |
| Other Fruit - |  |  |
| Fresh and Canned | 4 | 4 |
| Cooked | 4 | 2 |
| Potatoes | 27 | 13 |
| Leafy Green and Yellow Vegetables - | 6 | 3 |
| Cabbage and Greens | 1 | 1 |
| Lettuce, canned vegs. | 3 | 1 |
| Carrots, legumes | 16 | 8 |
| Other Vegetables | 89 | 54 |
| TOTAL: |  |  |

(a) Some vitamin C could be retained in these foods.

The table below shows the quantity of nutrients available for intake in the Australian diet (as shown in Table 13) less estimated cooking losses, compared with the desirable quantities recommended by the National Health and Medical Research Council.

There is a significant loss of thiamine in the cooking of meat and vegetables, the amount of loss depending on the method and duration of cooking. In a normal mixed diet it is accurate enough to allow 15 per cent. deduction from the total thiamine available.

TABLE 12: NUTRIENTS AVAILABLE FOR CONSUMPTION IN AUSTRAITA, 1957-58. COMPARED WITH RECOMMENDED ALLOWANGES
(Per Head per Day)

| Nutrient | Recommended <br> Allowances | Nutrients available less <br> estimated cooking losses |
| :--- | :---: | :---: |
| Calories (grammes) | 2,260 | 3,307 |
| Protein, | 61 | 92 |
| Calcium, (milligrammes) | 930 | 827 |
| VitaminA, (International units) | 4,480 | 7,937 |
| Thiamine, (milligrammes) | 1.13 | 1.08 |
| Riboflavin, (milligrammes) | 1.5 | 1.8 |
| Niacin, (milligrammes) | 11.3 | 18.4 |
| Ascorbic acid, (milligrammes) | 33 | 54 |

There was a slight increase in the number of calories, measuring the energy-yielding value of the diet, available in 1957-58 compared with 1956-57. This increase from 3,291 to 3,307 calories reflected a slightly higher consumption of calories from milk and meat products, potatoes and sweet potatoes, fruit and fruit products (other than tomatoes and citrus fruit) and pulse and nuts. A great part of this gain was offset by the decrease in consumption of calories from grain products.

The protein available in 1957-58 remained at a high level and as in 1956-57 and previous years was well in excess of the recommended allowance.

A small increase in thiamine contributed by meat and potatoes and sweet potatoes was observed. This increase from meat was primarily due to small increases in the consumption of pork, bacon and ham. However, this increase has been offset by decreased thiamine from grain sources. Riboflavin increased over the 1956-57 level, and much of this increase was due to milk and milk products, meats, potatoes and sweet potatoes, pulse and nuts. Meats, potatoes and sweet potatoes, pulse and nuts contributed more niacin than in the previous year, but the total increase in niacin has been lessened by a decrease in niacin from grain products. There was no significant difference in total iron available from that of 1956-57.

Although there was an increased amount of jitanin A contributed by meats and milk products this increase was nore than of iset by decreases from vegetables, tomatoos, and citrus and other fruits. It is to the slightly greater consumption of milk orodncts that the greater part of the inerease in galetun is due.

The amount of ascorbic acid was of a satisfactory level, and only slightly higher than in 1956-57. This intake could be attributed to an increase in availability of potatoes and sweet potatoes and certain vegetables, not quite offset by a decrease in consumption of tomatoes and citrus fruit.

Thiamine, riboflavin, niacin and ascorbic acid were all above the recommended allowance. The thiamine and ascorbic levels would be reduced by cooking (see page 11) but even with this reduction made, ascorbic acid was available in amounts greater than the level recommended. This level could be further lowered by unsatisfactory methods of storage and cooking.
SOURCE OF CALORIES IN THE AUSTRALIAN DIET, 1957-58

TABLE 15 : ESTIMATED SUPPLIES OF NUTRIENTS AVAILABLE FOR CONSUMPTION IN CERTAIN COUNTRIES

## (i) Milk and Milk Products (Excluding Butter)

The production of whole milk for all purposes during the year 1957-58 was approximately $1,261.1$ million gallons. This was 96.8 million gallons less than the preceding year but 107.9 million gallons in excess of the average production for the years 1946-47 to 1948-49.

During the three years ended 1938-39, 78 per cent. of Australia's milk supply was used for butter-making, 5 per cent. for cheese manufacture, 3 per cent. for condensery products and 14 per cent. for fluid consumption and other purposes. In the years following the war, there was a considerable decline in the quantity of milk used for butter although in more recent years with increasing production of milk there has been some reversal of this trend. The proportions in 1957-58 were 65 per cent. for butter, 6 per cent. for cheese, 6 per cent. for condensery products and 23 per cent. for other purposes.

Details of the quantity of whole milk produced and used for various purposes in the years 1953-54 to 1957-58 are shown in the following table in comparison with the average for the three years 1936-37 to 1938-39, and the average for the three years 1946-47 to 1948-49.

TABLE 16: WHOLE MILK : PRODUCTION AND UTILIZATION: AUSTRALIA ('000 Gallons)

| $1957-58(\mathrm{a})$ |  | $1,261,125$ | 814,391 | 75,728 | 76,775 |

(a) Subject to revision.

Details of the production and utilization of milk and milk products
(excluding butter) are shown in the tables following for the year 1957-58 in comparison with the earlier periods specified.

Production of condensed, concentrated and evaporated milk during 1957-58 showed a further slight increase being 400 tons larger than in 1956-57. Powdered milk production was 6,300 tons or 13 per cent. less than in 1956-57, while production of infants' and invalids' foods increased by 300 tons or 2 per cent. The output of all preserved milk products expressed in terms of whole milk equivalent amounted to 76.8 million gallons which was 1.3 million gallons or 1.7 per cent. less than the preceding year.

Total exports of condensery products in 1957-58 were 6,100 tons less then in 1956-57. A small increase was recorded in the exports of condensed, concentrated and evaporated milk while exports of powdered milk fell by 7,600 tons.

Cheese production reached the comparatively high level of 45,200 tons in 1956-57 but fell to 34,900 tons in 1957-58, a decrease of 23 per cent.

| Total－as milk solids（e） | 39.3 | 49.1 | 48.2 | 48.2 | 48.9 |

（a）Subject to revision．（b）Estimated weight of a gallon of milk， 10.3 lb 。 （c）Not available．（d）Includes malted milk and small quantities of non－fat malted milk．（e）The total figures are in terms of milk solids．Figures for individual commodities are actual net weights．

The apparent consumption per head of fluid milk increased from 240.21 b ． prewar to a peak of 316.7 Ib 。 in $1948-49$ ，but has since declined to 290.5 Ib ．in 1957－58．The lowest post－war level was reached in 1952－53 at 285．0 1b。 Consumption per head in 1957－58 was 8 per cent．less than the peak in 1948－49，but 21 per cent． greater than pre－war．Similar trends are evident in the estimated total consumption of milk and milk products（excluding butter）which increased from 39.3 lb ．（as milk solids）prewar to 49.1 lb o in the post－war period．During the three most recent years consumption has remained steady at slightly in excess of 48 lb ．per head．

## （ii）Meat

Production of meat（bone－in weight）in Australia during 1957－58 is estimated at $1,286,200$ tons exclusive of approximately 67,300 tons of edible offal．This was 16,100 tons above the previous record level achieved in the preceding year and 37 per cent．above average production over the three years ended 1948－49。

The production of beef and veal in 1957－58，although the second highest ever recorded，was 37,300 tons or 5 per cent．below the 1956－57 record of 814,600 tons，but was 234,900 tons or 43 per cent。 above the average for the three years ended 1948－49．

Mutton production in 1957－58 amounted to 261,200 tons exceeding the previous year by 37,300 tons or 17 per cent．and the aferage for the three years ended $1948-49$ by 84,700 tons or 48 per cent．

Lamb production increased in 1957－58 and at 150,000 tons was 7， 100 tons or 5 per cent．in excess of production for the previous year．

A sharp increase was recorded in the production of pork during 1957-58, the 1956-57 production of 40,600 tons being exceeded by 7,600 tons or 19 per cent.

Bacon and Ham production at 36,400 tons was slightly higher than that for the previous year, but was considerably below the average production of 45,100 tons over the three years 1946-47 to 1948-49.

The production of edible offal, which is not included with the carcass weight, is estimated at 67,300 tons in 1957-58 compared with 61,600 tons in 1956-57 and average production of 45,900 tons during the years 1946-47 to 1948-49。

Comparative details of the production of each class of meat are shown in the table below.

TABLE 20: PRODUCTION OF MEAT (BONE-IN WEIGHT): AUSTRALIA ('000 tons)

| Class of Meat | Average <br> $1936-37$ to <br> $1938-39$ | Average <br> $1946-47$ to <br> $1948-49$ | $1955-56$ | $1956-57$ | $1957-58$ <br> $(\mathrm{a})$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Beef and Veal | 569.1 | 542.4 | 751.1 | 814.6 | 777.3 |
| Matton | 201.4 | 176.5 | 234.4 | 223.9 | 261.2 |
| Lamb | 117.6 | 129.6 | 145.7 | 142.9 | 150.0 |
| Pork (b) | 45.4 | 31.5 | 42.9 | 40.6 | 48.2 |
| Bacon and Ham (Cured Weight) (c) | 32.5 | 45.1 | 37.5 | 35.3 | 36.4 |
| Total Pigmeats (as Pork) | 94.1 | 92.8 | 93.9 | 88.7 | 97.7 |
| Total Meat (in terms of fresh): | 982.2 | 941.3 | $1,225.1$ | $1,270.1$ | $1,286.2$ |
| Offal (Edible) | 48.0 | 45.9 | 59.6 | 61.6 | 67.3 |

(a) Subject to revision. (b) Includes estimates for trimmings from baconer carcasses. (c) Includes pressed and canned bacon and ham converted to bone-in-weight.

Particulars of the production and utilization of meat are shown in the three tables which follow. In the first table, separate details are given for each class of carcass meat, distinguishing between the quantities exported or consumed as fresh or frozen meat and the quantities used for canning and curing. The next table shows particulars of the production and utilization of processed meat, (canned meat and bacon and ham) and total output of processed meat in terms of carcass equivalent weight. Total production and utilization of all meat (excluding offal) expressed in terms of carcass equivalent weight is shown in the third table.

Exoorts of carcass meat has declined in both years since the post-war peak was reached in 1955-56. In 1957-58, 207,700 tons of carcass meat were exported compared with 211,700 tons in 1956-57 and 216,300 tons in 1955-56. Carcass meat exports in recent years, however, were still considerably in excess of the average. exports for the three years 1946-47 to 1948-49. The decline registered in 1957-58 in comparison with $1956-57$ was due to a reduction of $17 ; 800$ tons in exports of beef and veal which more than offset the increases in each of the other types of carcass meat.

Total meat exports (including canned and cured meat expressed in terms of carcass meat) during 1957-58 were 300,700 tans, an increase of 11,200 tons on 1956-57 but still 22,100 tons below the record exports of 1953-54.

Apparent Australian consumption of meat (including cured and canned in terms of carcass weight) in 1957-58 established a new record of 979,600 tons exceeding the previous record consumption of $1956-57$ by 13,400 tons.

TABLE 21. CARCASS MEAT (a) , PRODUCTION AND UTILIZATION: AUSTRALIA ('000 tons, Bone-in weight)

## MEAT: PRODUCTION AND UTILIZATION

COMMONWEALTH BUREAU OF CENSUS AND STATISTIGS
CANBERRA, A.C.T.
AUGUST, 1959

As a result of the rationing of meat，the apparent consumption per head fell during the 1939－45 War and immediate post－war years，and has since remained at a lower level than pre－war．Consumption in $1957-58$ was 236.7 Ib ．per head carcass weight．This is slightly lower than the previous year when 237.4 lb ．was consumed and 16.31 lb ．per head below average consumption during the years 1936－37 to 1938－39．

Beef and veal consumption，after increasing steadily during the post－war years to 131.6 lb 。 per head in $1950-51$ declined during succeeding years to 119.1 lb 。 in 1955－56．In 1956－57，consumption rose sharply to 128.9 lb ．per head but fell again in $1957-58$ to 121.2 lb ．per head．

The consumption of mutton increased by 3.0 lb ．per head during 1957－58 but at 49.8 lb ．was considerably less than the immediate prewar average of 59.8 lb ．Lamb consumption remained at the relatively high level of 28.0 Ib ．per head which was 13.0 lb．more than the average consumption during the three years 1936－37 to 1938－39．

Pork consumption（at 5.8 lb ．per head）in 1952－53 was at the lowest level recorded for any post－war year，but increased to 10.2 lb ．in $1954-55$ ，the highest recorded since the war．It fell in following years to 8.7 Ib ．in 1956－57 but increased in 1957－58 to 9.9 lb ．per head．The particulars relating to pork consumption embrace all pigmeats other than bacon and ham and include that used for smallgoods．At 6.9 lb ．per head，bacon and ham consumption in 1957－58 was 46 per cent．below the 1946－47 peak of 12.7 Ib ．

Owing to divergent cutting practices by butchers in this country and because of the difficulty of clearly defining the term＂retail weight of meat＂，it is considered impracticable to derive a satisfactory factor for the purpose of expressing estimated meat consumption in terms of retail weight．Depending on cutting practices employed and whether or not bones etc．sold to customers are included in retail weight of meat，the retail weight as a proportion of carcass weight ranges from about 60 per cent．to 75 per cent．for beef，from 80 per cent．to 95 per cent．for mutton and lamb and from 90 per cent．to 95 per cent．for pork．However，approximate estimates of the edible weight of meat consumed have been used for the purpose of calculating nutrient intake。

## （iii）Poultry，Game and Fish

Although details of the quantities of poultry and game entering consumption in Australia cannot be measured precisely＊，evidence available suggests that since the lifting of meat rationing on 21st June， 1948 there has been a fall in the consumption of poultry and game per head，which is estimated at 15.1 Ib 。 carcass weight（ 8.8 Ib ． edibie weight）during each of the years 1948－49 to 1957－58 compared with 16.1 ib． carcass weight（ 9.31 lb 。 edible weight）in $1947-48$ and average consumption of 9.7 Ib ． carcass weight（ 5.6 lb ．edible weight）during the three years ended 1938－39。

Production of fresh fish reached a post－war peak of 81.4 million lb． （live weight）in 1952－53 but in succeeding years has fallen to much lower levelso In 1957－58，recorded production amounted to 72.0 million lbog a decrease of 3.4 million 1 b ． compared with the previous year．These figures exclude the catch by fishermen other than commercial fishermen，the production by＂amateurs＂being taken as equal to 10 per cent．of commercial production for the purpose of estimating supplies available for consumption．

Compared with the previous year imports of fresh fish in 1957－58 increased by 7.9 million $1 b$ ．to 42.1 million $1 b$ ．This increase was more than sufficient to offset the fall in production and the total quantity available for consumption was 4.3 million lb．higher in 1957－58 than in 1956－57。

The consumption of fresh fish per head of population at 5.3 lb ．edible weight during 1957－58 was only slightly more than that of the previous year． Consumption of cured fish increased from 0.5 Ib ．per head in $1956-57$ to 1.3 Ib ．per head in 1957－58．

The production of crustaceans and molluses in 1957－58 totalled 42.4 million lb．（gross（in shell）weight），a small increase in comparison with 1956－57． Consumption fell from 0.9 lb ．per head in $1956=57$ to 0.8 lb 。in 1957－58．

Prior to the war，the consumption of canned fish in Australia was almost entirely from imported supplies，but since the war，fish canning in Australia has expanded considerably．Imports in 1956－57 amounted to 16.1 million $1 b_{\text {o }}$ and in 1957－58 to 17．6 million 1 b ．During 1957－58 30\％of canned fish consumed was from local supplies，consumption per head being 2.41 D ．（ 0.6 Ib 。 local and 1.8 Ib 。imported）．

Total consumption of fish（including canned）during $1957-58$ is estimated at 94.7 million 1b。 edible weight（ 9.8 Ib ．per head）as compared with 86.1 million lb． edible weight（ 9.01 b 。 per head）in the previous year．This is equivalent to approximately 186.6 million 1 b 。 live weight and 175.5 million 1 b ．live weight respectively．
＊See the preface of this Bulletin for an exposition of the methods of arriving at apparent consumption．

Particulars of the estimated supplies of each commodity included in this group available for consumption during the three prewwar years, the three postwar years and in each year $1955-56$ to $1957-58$ are show in the table belowo

## (iv) Ergs ari Ege Producy

Statistics of egg production mast necessarily be accepted with some
reserve. In the absence of a complete census of egg production, which would involve considerable labour and expense, it has been necessary to compute a figure based upon the best data available. The production show in the following table is based upon the records of Egg Boards of production fron areas under their control, plus estimates of production from uncontrolled areas and by "backward" poultry-keepers based on data obtained from other sources. On this basis, it is estimated that the level of total egg production in 1957-58 was abcut 191, 800 toxis (equivalent to about 191 million dozen) compared with maximm production of 122,000 tons ( 208 million dozen) in 1946-47 and the pre-war average of just undex 90,000 tons or about 154 million dozen. It should be noted that the estimated decline in total egg production since 1946-47 is based very largely on trends in comeroial production (controlled by Egg Boards). Data as to the trend in non controiled production are at present inadequate.

Exports of shell eggs during 1997.58 amounted to 7,300 tons, compared with 6,300 tons during the previous year and average exposts of 10,400 tons during the three years ended 1948-490 The postwar peak was during 1949-50 when 14,000 tons were exported.

In 1957-58 production of egg palp was the lowest recorded since the war. Expressed in terms of weight of shell eggs it amounted to 13,500 tons compared with 16,500 tons in 1956-57 and an average of 20,000 tons for the three years ended 1948-49. Exports of egg pulp in 1957-58 were 8, 200 tons (expressed in terms of weight of shell eggs) compared with 9,400 tons in the preceding year.

The production of egg powder which was introduced to meet the wartime needs of the armed forces has in postawar years decined to barely significant levels. In 1957-58, 231 tons (expressed in terms of weight of shell eggs) were produced.

Comparative details of the production and utilization of eggs and egg products are shown in the following table:-

TABLE 26 : EGGS AND EGG PRODUCTS : PRODUCTION AND UTILIZATION : AUSTRALIA ( 1000 tons)

## (v) Oils and Fats (including Butter)

Reference is made in Section 3 (i) to the usage of milk for butter making. Production of butter reached a post-war peak of 208,900 tons in 1955-56 compared with an average of 191,000 tons for the three year period 1936-37 to 1938-39. In 1956-57 production declined by 16,000 tons or 8 per cent。 and in 1957-58 a further fall of 17,100 tons or 9 per cent. was recorded in comparison with the previous year.

Exports of butter also fell in 1956-57 and 1957-58 in comparison with each preceding year. The 1957-58 exports of 52,200 tons were 25,600 tons, or 33 per cent. less than those recorded in 1956-57.

The production of table margarine for consumption in Australia is restricted by State legislation. Some easing of the restrictions in recent years has resulted in a larger production than hitherto, 11,900 tons being produced in 1955-56 and 16,400 tons in 1956-57. In 1957-58, however, production fell to 15,800 tons.

The production of margarine other than table amounted to 21,000 tons in 1957-58, 1,000 tons more than in 1956-57.

Comparative details of the production and utilization of butter and of both grades of margarine are skown in the following table：－

（a）Subject to revision．（b）Includes allowance for unrecorded stock movements． （c）Not available。
（d）Includes dry butter fat，ghee and tropical spread expressed as butter．

The termination of butter rationing in June，1950，was followed by a sharp increase in consumption of butter to a level approaching that of pre－war years （average consumption during the three years ended 1938－39 was 32．9 1b．per head）． After fluctuating at around 30 lb 。 per head per annum，a tendency to a decline has been evident in recent years．Consumption per head in 1957－58 amounted to 27．8 1b。 compared with 28.0 1b．in 1956－57 and 29．0 1b。 in 1955－56．

Margarine consumption，which fell immediately following the termination of butter rationing，rose again in subsequent years and has since been at a higher level than pre－war or during the period of butter rationing．In 1957－58 the consumption of table margarine per head of population remained at the $1956-57$ level of 3.6 lb ． compared with 3.0 Ib ．in $1955-56$ and an average of 0.9 lb ．for the three year period ended 1938－39．Although the consumption of margarine，other than table，increased slightly to 4.8 lb ．per head in $1957-58$ it was still below the average for the three post－war years of 5.2 lb ．per head．

Details of the estimated supplies of "visible" fats and oils available for consumption per head of population are show in the following table for the three years ended 1938-39, the three years ended 1948-49 and for each year 1955-56 to 1957-58.

TABLE 29: SUPPLIES OF "VISIBLE" FATS AND OILS AVAILABLE FOR CONSUMPTION AUSTRALIA

## (vi) Sugar and Syrups

During the war, due to labour shortages, adverse seasonal conditions, etc. output of cane sugar fell to levels well below those ruling in the immediate prewar period.

In post-war years,however, production has expanded considerably, a record of 1,243,000 tons raw (1,283,500 tons at 94 net titre) being established in 1953-54. Following falls in production in 1954-55 and 1955-56 an increase occurred in 1956-5? to $1,217,700$ tons ( $1,253,900$ tons at 94 net titre). Production in 1957-58 was estimated at $1,222,200$ tons (1,255,300 tons at 94 net titre) a figure which has been exceeded only by the record production of 1953-54. These figures are on a year ended June basis and are not comparable with figures shown in Section 1 of this Bulletin which are on a seasonal basis.

The following table shows details of production and utilization of raw sugar for 1957-58 with comparative details for the previous years indicated. Beet sugar is included.

RAW SUGAR: SUPPLIES AND UTILIZATION

COMMONWEALTH BUREAU OF CENSUS AND STATISTICS
CANBERRA, A.C.T.
AUGUST, 1959

In the next table, details of supplies of sugar (including sugar contained in manufactured products) and syrups available for consumption per head of population are shown for specified years.

TABLE 31 : SUPPLIES OF SUGAR AND SYRUPS AVAILABLE FOR CONSUMPTION : AUSTRALIA (Ib. per head per annum)

| Commodity | Average <br> $1936-37$ to <br> $1938-39$ | Average <br> $1946-47$ <br> $1948-49$ | $1955-56$ | $1956-57$ <br> (a) | $1957-58$ <br> (a) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Refined Sugar - As Sugar |  |  |  |  |  |
| In Manufactured <br> Products | 70.6 | 68.7 | 62.4 | 61.1 | 59.7 |
| Total: | 35.9 | 51.0 | 52.7 | 51.7 | 53.1 |
| Syrups, Honey and Glucose <br> (Sugar Gontent) <br> Total Sugar Content: | 106.5 | 119.7 | 115.1 | 112.8 | 112.8 |

(a) Subject to revision.

The consumption of sugar (excluding that consumed in manufactured products) during $1946-47$, the last complete year of rationing, was 65.9 lb o per head compared with 70.6 lb 。 per head during the premar period. It rose initially following the cessation of rationing but has since fallen and, in recent years, has been at a lower level. Since 1953-54, when 65.0 1b. per head were consumed there has been a decline to 62.9 lb . in $1955-56,61.1 \mathrm{lb}$. in $1956-57$ and 59.7 in 1957-58.

While consumption of sugar as such has shown a recent tendency to decrease the total sugar consumed per head of population has until 1955-56 shown a steady increase due to greater consumption of sugar in manufactured products. In 1956-57 and 1957-58 however, total consumption was 112:8.1b, per head compared with 115.1 lb . in 1955-56.

The estimates of sugar consumption given in this Bulletin represent apparent consumption measured in terms of disposals of sugar by refineries and sugar content of disposals of sugar products by manufacturers. In general, the estimates do not take into account stocks in the following categories in respect of which inadequate data are available:-
(i) Wholesalers', retailers' and householders' stocks of sugar.
(ii) Sugar content of stocks of manufactured products held by producers, wholesalers, retailers and householders.

The consumption of syrups (golden syrup and treacle), honey and glucose expressed in terms of sugar content was 4.8 lb . per head in 1957-58 compared with 5.6 Ib. in 1956-57.

The consumption of all sugar and syrups (expressed as sugar content) per head of population, amounted to 117.6 Ib . in 1957-58 compared with 118.4 Ib . in 1956-57, 125.3 lb . in the immediate postmar period and 112.0 lb . in the pre-war period.

## (vii) Potatoes (White and Sweet)

In the following table, details relating to the production and utilization of white and sweet potatoes are shown for the prewar period, the average of the three years 1946-47 to 1948-49, and each of the years 1955-56 to 1957-58. The data relating to white potatoes have been compiled from information supplied by State Potato Marketing Boards, in addition to that collected by Statisticians, plus an estimate for self - suppliers and, in post-war years, relate to the season ended October.

Production was expanded considerably during the war years to meet the requirements of the Armed Forces and reached a peak of 686,400 tons of marketable potatoes in 1944-45. Production declined in each succeeding year to 1950-51 when the marketable crop amounted to 408,900 tons. In 1955-56, production returned to the comparatively high level of 524,000 tons and this was exceeded by 10 per cent. in 1957-58 when production increased to 575,400 tons.

After the war, a small export trade in potatoes was built up. During 1951-52, 41,000 tons were exported, but in following years smaller quantities were shipped. In 1957-58, only 7,300 tons were exported.

Production of sweet potatoes in 1957-58 is estimated at 6,100 tons compared with the pre-war level of about 7,400 tons.

TABLE 32: POTATOES. PRODUCTION AND UTILIZATION : AUSTRALIA

| Exports | - | - | - | - | - |
| Apoarent Consumption | 7.4 | 5.3 | 5.8 | 6.0 | 6.1 |

(a) Subject to revision. (b) Not available. (c) Stocks in Potato Comnittee Store and carry-over on farms. Comparable figures for other periods are not available. (d) Marketable production. (e) Including quantities used for canning and dehydration.
(f) Fresh potatoes only.
(g) Years ended June.

The estimated consumption of potatoes rose continuously from the prewar level of 106.2 lb . per head ( 103.8 Ib . of white and 2.4 Ib . of sweet) until 1946-47, when a total of 134.8 lb . was consumed. It has since fallen and has generally fluctuated around the pre-war level. During 1955-56, there was an acute shortage of potatoes in most States towards the latter part of the season. Consumption was consequently at the very low level of 90.1 ib . With the return of production to comparatively high levels in 1956-57 and 1957-58 consumption rose to 109.4 lb . per head and 120.5 lb. per head respectively.

Comparative details of the consumption of both white and sweet potataes per head of population are shown in the following table. It should be noted that little information is available concerning recent trends in home growing of potatoes and the estimates of total consumption shown below must therefore be regarded as approximate.

TABLE 33: SUPPLIES OF POTATOES AND SWEET POTATOES AVAILABLE FOR CONSUMPTION: AUSTRALIA

[^2]
## （viii）Pulse and Nuts

Details of the supply and utilization of dried pulse（mainly blue peas， split peas and navy beans）and peanuts are shown in the following table．Following several years of small imports，larger quantities of peanuts were brought in from overseas in 1957－58，7，600 tons（in shell weight）being recorded compared with 100 tons in 1956－57 and 300 tons in 1955－56．Production of peanuts since the war has varied between the limits of 4,800 tons in 1952 and 18,600 tons in 1954 and in the 1957 season was 8,900 tons．

The other commodities included in this group consist of edible tree nuts and cocoa（raw beans）．Edible tree nats consumed in Australia now consist principally of imported coconuts and locally－grown almonds and walnuts，while cocoa supplies are obtained entirely from imported beans．

（a）Subject to revision．
（b）Held by the Field Peas Marketing Board of Tasmania．
（c）Not available。
（d）Estimate based on 1936 Survey of household consumption．
（e）Held by Peanat Board．Comparable figures are not available for later years．

The estimated supplies of the commodities in this group，available for consumption per head of population，are shown in the following table．The apparent consumption of dried pulse per head increased considerably after the war but since 1953－54，has fallen from 3.7 lb 。 per head to 3.3 lb 。in $1956-57$ and 1957－58。 The consumption of peanuts（including salted peanuts and as peanut butter or paste）in terms of the kernel equivalent，showed remarkable expansion from 0.9 lb ．per head pre－war to an average of 2.51 b 。 per head over the three years ended 1948－49。 In some recent years consumption has fallen to extremely low levels being only 0.7 Ib ． per head in 1956－57 but increased to 2.1 lb 。in 1957－58．It should be pointed out that it is likely that some of the apparent fluctuations in the consumption of peanuts arises from the lack of information on Stocks．The consumption of tree－nuts in terms of the kernel equivalent declined during the war，but in 1950－51 amounted to 2.3 lb ．per head compared with 0.8 lb ．pre－war．It has since fallen again and in 1957－58 amounted to 1.71 b ．per head．The consumption of cocoa beans declined from an average of 3.4 lb ．per head during the three years ended 1948－49 to 2.7 Ib ．per head during 1957－58．

Apparent consumption of the whole group per head rose from an average of 9.2 1b. during the three years ended 1948-49 to a post-war peak of 11.7 lb . during 1949-50. Consumption in subsequent years has been below this level and during 1957-58 was 9.8 1b. per head.

## (ix) Tomatoes and Citrus Fruit

The estimated total production of fresh tomatoes and citrus fruit is shown in the following table. The figures are based on the output recorded on growers" annual returns together with estimates of production by self-suppliers. Tomato production in the prewar period is probably under-stated, owing to the lack of complete data at that time.

The table also shows details of the utilization of tomatoes (including tomato products expressed in terms of fresh tomatoes) and citrus fruit (including citrus products in terms of fresh fruit). Allowance for wastage of both products is also shown.

Tomato production, which reached the record level of 150,500 tons in 1956-57, declined in 1957-58 to 123,000 tons, a reduction of 18 per cent. Exports, which are principally in the form of juice, amounted in 1957-58 to 3,000 tons (fresh equivalent) compared with 2,700 tons in 1956-57. During some recent years, significant quantities of tomato paste have been imported usually from Italy but in 1957-58 the fresh equivalent of all tomato products imported was only 500 tons, compared with 11,800 tons the previous year.

Citrus fruit production declined in both 1956-57 and 1957-58 in comparison with the preceding year. Production in both these years, however, was greatly in excess of the average production for the years 1946-47 to 1948-49。 Exports of citrus fruit which have varied only slightly during the last three years amounted to 12,900 tons in 1957-58.

（a）Subject to revision．（b）Includes fresh equivalent of manufactured productso （c）Stocks of tomato products held by factories at fresh equivalent weight．（d）Not available。（e）Probably under－stated because of the absence of complete data． （f）Revised．

In the next table，details are given of the estimated supplies of these commodities moving into consumption per head of population．As mentioned above，the figures relating to tomato consumption in the pre－war period are probably understated， owing to the absence of complete data relating to production．The consumption of tomatoes per head of population has shown considerable variation in the years since the war．In 1946－47 a consumption of 30.6 ib ．per head was recorded but a steady decline followed until the comparatively low level of 18.4 lb ．was reached in 1953－54． Consumption after $1953-54$ increased significantly and reached a record of 32.3 lb ．per head in 1956－57 but fell in 1957－58 to 26．0 1b．per head．

Citrus fruit consumption per head of population declined in 1957－58 to 35.2 lb ．compared with 37.8 lb ．in $1956-57$ and a record consumption of 40.4 lb ．per head in 1955－56。

It should be noted that the figures relating to consumption of citrus fruit are slightly overstated，as no allowance has been made for fruit used in jam which has been exported．

## （x）Fruit and Fruit Products（excluding Tomatoes and Citrus Fruit）

Details of the production and utilization of fresh fruit（other than tomatoes and citrus fruit）and products thereof，namely jars，dried fruit and preserved fruit are shown in the table below．

Production of fresh fruit has shown considerable variation since the war and in 1957－58 reached a record when 720,700 tons were produced exceeding the previous record of $1956-57$ by $1,233,000$ tons or 21 per cent．

Exports of fresh fruit in 1957－58 reflected the abnormally high production and at 147,100 tons were 46,500 tons in excess of the previous year．

Jam production which in recent years has been considerably below the level of the immediate post－war years increased in 1957－58 to 49，200 tons，7，000 tons more than the $1956-57$ production but 25，000 tons or 34 per cent．less than average production for the years 1946－47 to 1948－49。

In 1957－58 both production and exports of dried vine fruits increased in comparison with the preceding year．The increase in production was 20,900 tons or 35 per cent．while exports increased by 14,200 tons or 33 per cent．

Comparatively small movements occurred in the levels of imports and production of dried tree fruits although in both instances there was a decline in comparison with both pre-war and post-war averages. In 1957-58 imports were 700 tons more than 1956-57 and production 300 tons less.

Production of preserved fruit in 1957-58 at 152,600 tons was a new record and amounted to 20,700 tons more than $1956-57$ production. Exports of preserved fruit in 1957-58 were 13,900 tons above the 1956-57 figure but at 74,000 tons were considerably below the post-war peak of 96,500 tons recorded in 1954-55.

(a) Subject to revision.
(b) Not available.
(c) Includes imports.
(d) Includes wastage.
(e) Data for post-war years relate to years ended December.
(f) Packing house stocks; comparable information is not available for other periods.

Details of the supplies of the commodities included in this group moving into consumption per head of population are show in the following table．The apparent consumption of fresh fruit per head during 1957－58 was 83.0 lb 。 This was 17 per cent． above the previous year and 5 per cent．below average consumption over the three years ended 1948－49．Consumption of jam in 1957－58 was at the relatively low level of 7.9 lb ．per head compared with 9.7 lb ．in the previous year and an average of 12.4 lb ． for the three years ended 1948－49．

Available statistics indicate that the consumption of preserved fruit was 13.8 lb ．per head during 1957－58．This was 0.6 lb ．per head less than the record consumption of 1951－52，but 0.4 1b．per head above consumption in 1956－57．It must be emphasised，that，as mentioned in the preface to this Bulletin，data used in calculating consumption are deficient to the extent that no information is available on changes in wholesalers ${ }^{7}$ or retailers ${ }^{8}$ stocks．

Estimated consumption of the whole group，sxpressed in terms of fresh fruit per head of population，increased from 113.1 Ib ．in $1956-57$ to 132.5 lb 。 in 1957－58 compared with the post－war peak of 145.0 lb ．reached in $1947-48$ and an average of 140.7 lb 。 in the three years ended 1948－49。

（a）Subject to revision．（b）Data for post－war years relate to year ended December．

## （xi）Leafy．Green and Yellow Vegetables

Data relating to production of vegetables included in this and the following group are obtained from commercial output as returned by growers at the annual census of farm production，to which have been added allowances for production by self－suppliers．The vegetables included in these groups do not include potatoes which are shown in Section 3 （vii）；Pulse，shown in Section 3 （viii）；and Tomatoes， shown in Section 3 （ix）．

It should be pointed out that the annual census returns make provision for growers to record their production in units in which they are normally marketed，e．g． details of potatoes and other root crops are collected in tons；cabbages，cauliflowers， etc．in dozens，whilst others are obtained in such units as bushels，bags，bunches， cases，etc．In expressing these items in terms of tons of $2,240 \mathrm{lb}$ ．in this Bulletin， care has been taken to obtain appropriate factors from official sources，and while their precision has not been wholly established，it is reasonably certain that any error is not sufficient to impair significantly their reliability．

The production of vegetables was considerably expanded during the war years to provide increased supplies in fresh and processed form for the Armed Forces．Since the war，curtailment of production has taken place and there has been a dowward trend in consumption，but this may have been offset to some extent in more recent years by increased home growing of vegetables．However，data concerning recent trends in ＂back－yard＂vegetable production are not at present available and no change has been made to the allowance for this production．

Following the end of the war，the production of canned vegetables included in groups（xi）and（xii）declined．Total production was 29,800 tons in 1957－58 compared with 41,000 tons in 1945．Green peas are the principal vegetables now being preserved．

Attention is directed to the qualification relating to stocks (namely, lack of data on retailers' and wholesalers ${ }^{\text {' }}$ stocks), mentioned in the preface to this Bulletin. As a result of the deficiency in stock data, the actual consumption of preserved vegetables may possibly vary somewhat from the figures shown.

Particulars relating to the production and utilization of leafy, green and yellow vegetables in the fresh and preserved form are shown in the following table:-

## TABLE 40 : VEGETABLES, LEAFY, GREEN AND YELLLOW : PRODUCTION AND UTILIZATION : AUSTRALIA ('000 Tons)

(a) Subject to revision.
(b) Not available.
(c) Revised.

In the next table, details are shown of the apparent consumption per head of population, of the items included in this group. Consumption of the group as a whole has declined somewhat since 1943, owing principally to the reduced supplies of fresh legumes and cabbages and greens available.

## TABLE 41 : SUPPLIES OF LEAFY, GREEN AND YELLOW VEGETABLES AVAILABLE FOR CONSUMPTION : AUSTRALIA <br> (lb. per head per annum)

| Commodity | $\begin{gathered} \text { Average } \\ 1936-37 \text { to } \\ 1938-39 \\ \hline \end{gathered}$ | $\begin{gathered} \text { Average } \\ 1946-47 \text { to } \\ 1948-49 \end{gathered}$ | 1955-56 | 1956-57 | ${ }_{(\mathrm{a})}^{1957-58}$ |

(a) Subject to revision. (b) These figures relate to 1943. In the absence of data for the pre-war period, consumption is assumed to be the same as in 1943, for the purpose of nutrient calculations. (c) Revised.

## (xif) Other Vegetables

The vegetables included in this group are pumpkins, white and swede turnips, beetroot, onions, parsnips, cauliflowers, cucumbers, marrows, squashes and sweet corn.

The comments included above in respect of group (xi) apply also to this group of vegetables. The relevant details relating to production, utilization and consumption per head of population are shown in the two tables following. Consumption of this group per head was 21.8 lb . higher in 1957-58 than in 1956-57 and 24.5 lb . per head higher than the average of the three immediate post-war years.

(a) Subject to revision. (b) This figure relates to 1943. In the absence of data for the pre-war period, consumption is assumed to be the same as in 1943, for the purpose of nutrient calculations.

## (Xiii) Grain Products

Although the acreage sown to wheat for grain was somewhat higher in 1957-58 than in 1956-57 it was still comparatively low and this fact, combined with the low average yield due to poor seasonal conditions, was responsible for the abnormally low production of $97,566,000$ bushels.

The barley harvest, considering that the acreage sown to grain was a new record, reflected the poor seasonal conditions and the $30,465,000$ bushels of grain produced was $18,813,000$ bushels less than the production of the previous year. Maize production at $5,639,000$ bushels was 145,000 bushels in excess of the previous record of $1956-57$ while oat production declined to $31,425,000$ bushels, $3,971,000$ bushels below the level of the previous year. Due mainly to a high average yield the production of rice created a new record of $5,658,000$ bushels, 578,000 more than the previous record of 1954-55.

Details of the production of the principal cereals for grain during each of the years 1955-56 to 1957-58 in comparison with average production during the five years ended 1938-39 and the three years ended 1948-49 are shown in the following tables:-

TABLE 44 : PRODUCTION OF CEREALS FOR GRAIN : AUSTRALIA ('000 Bushels)

| Crop | Average <br> Five Years <br> Ended <br> $1938-39$ | Average <br> Three Years <br> Ended <br> $1928-49$ | $1955-56$ | $1956-57$ | $1957-58$ <br> (a) |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: |

(a) Subject to revision. (b) Included with Flour. (c) Included with stock feed. (d) Includes allowances for unrecorded movements in stocks, gain or loss in outeturn, etc.
wheat and Details of the production and utilization of the principal products from wheat and other cereals are shown in the table on the folloving page.

The production of flour which had increased in both 1955-56 and 1956-57 fell sharply in $1957-58$ to $1,210,100$ tons, 246,900 tons or 17 per cent. below the previ ous year and 220,300 tons or 15 per cent. below the average production for the years 1946-47 to 1943-49.

Exports of flour in 1957-58 amounted to 431,000 tons, 255,800 tons or 37 per cent. less than 1956-57 and also cinsiderabiy below the average annual exports for both pre-war and post-war periods.

Production of milled rice in 1957-58 was 3,700 tons more than in the previous year.

The production of oatmeal (including rolled or crushed oats) reached the record level of 34,000 tons in 1947-46. Output during subsequent years was considerably less, standing at 13,900 tons in 1957-58.

The output of other grain breakfast foods amounted to 45,600 tons in 1957-58. Consumption at 43,300 tons was considerably above the immediate post-war average of 28,200 tons.

(a) Subject to revision.
(b) Sharps are included for years 1955-56 to 1957-58.
(c) Includes imports.
(d) Not available.
(e) First two columns refer to wheatmeat for porridge only. Figures for three latest years also include invalid and health foods, semolina and wheat germ.

The next table shows details of grain products available for consumption per head of population．The main item in this group is flour，the apparent consumption of which decreased from 185.9 Ib ．per head in $1956-57$ to 181.2 Ib ．in 1957－58．

Since the pre－war period，there has been a decline in the consumption of oatmeal which has been offset by increased consumption of breakfast foods from other grains，mainly prepared foods．The consumption of rice per head increased from 1.1 1b．in 1949－50 to the record level of 4.7 Ib 。 in 1951－52，an increase which is directly attributable to the lifting of restrictions on sale to the public from 3rd October，1950．Consumption during the last three years has remained steady at 3.7 1b．per head．

## （xiv）Beverages

The items incluaed in this group comprise tea，coffee，beer and wine。 Particulars of the production and utilization of beer and wine are shown in the following table。

The production of beer in 1957－58 was，at $233,401,000$ gallons， 356,000 more than the previous record production of $1955-56$ and exceeded the average output for the three years ended $19480-49$ by $99,848,000$ gallons or 75 per cento The quantity of beer exported is small and almost the entire production is available for consumption in Aùstralia．

Beverage wine production during 1957－58 is estimated at 15，050，000 gallons． This was 364,000 gallons less than production in 1956－57 and 1，999，000 gallons less than the record production of 1951－52．Exports of beverage wine in $1957-58$ arounted to $1,523,000$ gallons，a reduction of 266,000 gallons in comparison with $1956-5 \%$ 。

（a）Subject to revision．（b）Not available－See footnote（c）．（c）Balance figure； includes beer waste and allowance for net change in brewery stocks．（d）Movements in stocks of Australian fortified wine in Bond．（e）Movement in wholesalers stocks． （f）Production of beverage wine．（g）Balance figure；includes waste and allowance for net change in unrecorded stocks．（h）Not available．

Details of the apparent consumption of each commodity included in the group，per head of population，are shown in the following table．

In 1957－58 consumption of tea based on sales by importers，at 6.0 lb 。 per head was below average consumption for both pre－war and post－war periods．Coffee consumption based on imports cleared with no allowance for stock changes has increased from the level of 1.0 lb ．per head during the three years ended 1945－49 to 1.3 lb．in 1955－56 and 1.6 lb ．in 1956－57．In 1957－58 consumption declined slightly to 1.5 lb ．per head．

Beer consumption statistics are based on the quantity of beer remored from breweries，duty paid，pius the quantity removed free of duty for consumption in Australia，with the addition of small quantities of imports cleared for home consumption．Consumption of beer per head was 23.0 gallons（ 230.0 lb ．）in 1957－58 compared with an average of 16.9 gailions（ 169.2 lb ．）during the three years ended 1948－49 and 11.7 gallons（ 116.6 lb 。）during the three years ended 1938－39．

Wine consumption reached its highest level in Australia during 1951－52 at 1.8 gallons（ 18.4 lbo ）per head．This compares with an average of 1.3 gailons （ 13.2 lb ．）during the three years ended 1948 m 49 and average consumption of 0.6 gallons（ 6.4 lb 。）during the years 1936－37 to 1938－39．Consumption in 1957－58 was 1.1 gallons（ 11.7 lbs ）。

## 4. DETAILED STATISTICAL DATA SHOWING ESTIMATED SUPPLIES AND UTILIZATION

## OF FOODSTUFFS, YEAR 1957-58

The data presented in the previous pages of this Bulletin for the year 1957-58 are based upon the statistics in the following table, which show the supply position in Australia for each item included in the fourteen groups covered, and provide a detailed analysis of distribution, movement in stocks and the apparent quantity consumed for the year ended June, 1958. In cases where production is of a seasonal nature, e.g. tomatoes, citrus and other fresh fruit and vegetables, including potatoes, it is not possible to relate production and distribution strictly to fiscal or calendar years. It has been necessary, therefore, to apply details appropriate to the seasonal period covered by the years specified.

With the exception of fluid whole milk, beer and wine, particulars of which are shown in gallons, all other commodities are recorded in units of tons of $2,240 \mathrm{lb}$. In those cases where this unit is not appropriate, the consumption per head has been expressed in terms of common usage (eogo fresh milk is shown in gallons as a footnote to the table).

The data included in the following table, in respect of the year 1957-58 are generally subject to revision.
49.

than those held by millers.
TABLE 50: ESTIMATED SUPPLIES AND UTILIZATION OF FOODSTUFFS . AUSTRALIA
YEAR ENDED JUNE, 1958 (Continued)

[^0]:    ＊See the Preface to this Bulletin for an exposition of the method of arriving at apparent Australian consumption together with a statement of the reservations attaching to the consumption estimates．

[^1]:    Apparent consumption of mutton and lamb per head of population has fluctuated considerably since the war. Until 1951-52 it was below the pre-war average, but in each of the following six years it was either at or slightly above this level. In 1958-59 apparent consumption showed a comparatively large increase and is estimated to have risen to 17 per cent. above the prewar average.

[^2]:    (a) Subject to revision.
    (b) Includes the fresh equivalent of canned potatoes.
    (c) Years ended June.
