<b>I SUPPLY AND UTILISATION OF FOODSTUFFS</b>	
1. Apparent consumption of certain foodstuffs: Australia	6
2. Estimated supply and utilisation of foodstuffs: Australia, 1975-76	8
3. Estimated supply and utilisation of foodstuffs: Australia, 1976-77	12
<b>II LEVEL OF NUTRIENT INTAKE</b>	
4. Estimated nutrients available for consumption in each commodity group, unadjusted: Australia	17
5. Adjustments to the availability of specific vitamins: Australia	18
6. Percentage of total energy derived from each commodity group: Australia	18
7. Estimated nutrients available for consumption: Australia	18
8. Dietary allowances of nutrients: Australia	19
9. Nutrients available for consumption, compared with dietary allowances : Australia	19
10. International comparison of estimated nutrients available for consumption	20

## EXPLANATORY NOTES

This publication contains detailed statistics of the consumption of foodstuffs and nutrient intake in Australia for the years 1975-76 and 1976-77 as well as comparative data for earlier years. Part I deals with the supply and utilisation of foodstuffs, while Part II deals primarily with the level of nutrient intake in Australia. These levels are compiled by officers of the Nutrition Section of the Commonwealth Department of Health to whom thanks are extended.

The following mean population figures (year ended 30 June basis) have been used in this publication:

Average 3 years ended —

1938-39	6,870,261
1948-49	7,651,558
1958-59	9,741,073
1968-69	11,919,046

Individual years —

1971-72	13,063,866
1972-73	13,281,194
1973-74	13,488,234
1974-75	13,695,682
1975-76	13,846,241
1976-77	13,991,838

The population figures for the period 1971-72 to 1974-75 have been revised in the light of results obtained from the 1976 Census of Population and Housing.

### Factors affecting consumption estimates

In interpreting the figures shown in this publication the following factors should be noted:

(a) Changes in the composition of the population have a bearing on trends in the patterns of consumption (particularly on estimates of consumption per head of population). The most significant change since 1945, which has almost certainly had some effect on the consumption pattern, is the increasing proportion of the population born overseas and resident for only a comparatively short period in Australia (e.g. the proportion of the population born overseas was 9.8 per cent in 1947, 14.3 per cent in 1954, 16.9 per cent in 1961, 18.4 per cent in 1966, 20.2 per cent in 1971 and 22.4 per cent in 1976).

(b) Another similar factor is the age distribution of the population which may also affect data relating to consumption per head. For example, while consumption per head of infants' and invalids' food has been calculated on the basis of the mean Australian population for the years concerned, these commodities are clearly consumed by a relatively small proportion of people. The effective consumption per head by

these consumers would therefore be considerably higher than the figures shown in the relevant table.

(c) In general, the statistics in the publication are for financial years. However, where there is a marked seasonal pattern in the production or marketing of certain crops, the statistics in practice refer to crop years. For example, statistics relating to commercial production of citrus fruit are on the basis of the year ending 31 March.

### Changing trends

With the object of illustrating changing trends in the pattern of food consumption in recent years, estimates for 1976-77 have been compared with averages for the 3 years ended 1968-69.

- . While variations in the consumption of different types of meat have been pronounced during this period, the total intake of meat has increased only slightly. The consumption of milk and milk products, on the other hand, has fallen particularly for fluid whole milk. These changes are reflected in increases in animal protein and a decrease in calcium available for consumption.
- . An increase in the consumption of fat associated with increased consumption of meat has been balanced by a decrease in the oils and fats group.
- . There have been considerable changes in the relative proportions of butter and margarine consumption in the oils and fats group. Between the 3 years ended 1968-69 and 1976-77 margarine increased from 33.3 per cent of the total to 59.9 per cent.
- . Total availability of carbohydrate has decreased marginally during the decade, due mainly to a reduction in the amount of flour available for consumption.
- . Sugar available for consumption has fluctuated over the period, rising from 51.9 kg per head in the 3 years ended 1968-69 to 54.4 kg in 1973-74 and 55.6 kg in 1975-76. In the last year apparent consumption has dropped slightly. However, of greater significance than this total change has been the growth in the proportion of sugar derived from manufactured foods, which has increased from 53.4 per cent in the 3 years ended 1968-69 to 64.1 per cent in 1976-77.

. Other changes during this period include small increases in the availability of riboflavin, niacin and iron, probably due to the increase in the apparent consumption of breakfast cereals, which are fortified with these nutrients. Both total energy available for consumption and the availability of vitamins A and C have fluctuated slightly between the 3 years ended 1968-69 and 1976-77. Of all the nutrients examined,

the apparent level of vegetable protein intake has undergone the sharpest decline, from 40.3g per head per day to 31.5g.

## I. SUPPLY AND UTILISATION OF FOODSTUFFS

In general, the method employed in this publication to estimate consumption in Australia of each of the various foodstuffs is as follows:

**Apparent consumption** = (Commercial production + Estimated home production + Imports + Opening stocks) minus (Exports + Ships' and aircraft stores + Usage for processed food + Non-food usage + Wastage + Closing stocks).

**Consumption per head** = Apparent consumption divided by the mean population for that period.

There are four significant factors which should be noted in regard to the estimates of consumption:

1. **Consumption.** Because of qualifications in respect of stocks and wastage (described below), the term "consumption" is used in a specialised sense, since the quantities actually measured are broadly the quantities available for consumption at a particular level in the process of distribution, i.e. ex-market, ex-store or ex-factory, depending on the method of marketing and/or processing. It is considered that in most cases these foodstuffs will find their way to the ultimate individual consumers with a minimum time lag. The figures therefore represent fairly accurately total consumption, as defined above, in the year to which they relate.

The general consumption equation is not used in those instances where certain components of the equation are not available, or where a more appropriate technique of estimating consumption is available. In this publication the equation is not used for rice, bread, butter, beer, wine and spirits.

2. **Commercial production and estimated home production.** Available production statistics are confined mainly to commercial production and are deficient for the purposes of the calculation to the extent of production by householders for their own use. This applies particularly in the case of vegetables, fruit, eggs, poultry and fish. However, in all these cases estimates of non-commercial production have been included, based on somewhat inadequate information obtained from a household expenditure survey conducted in 1944 and other investigations conducted by government departments during the 1939-45 War.

3. **Stocks.** Statistics of stocks refer to in-store (i.e. those held by marketing authorities) and factory stocks. With minor exceptions no details are available of wholesalers', retailers' or householders' stocks. For perishable commodities this point is of little importance since the very nature of the commodity precludes the accumulation of stocks. This is not the case, however, with non-perishable foods, and estimates derived for consumption of such foodstuffs for individual years may not state the position correctly with regard to

consumption as ordinarily understood, i.e. foodstuffs consumed by the individual. This difficulty is apparent particularly in the case of canned foodstuffs, where in some years it has been necessary to initiate special enquiries from the trade and other informed sources in an endeavour to take better account of these deficiencies.

4. **Wastage.** In many cases, allowance is not made for wastage before the foodstuffs are consumed. The importance of this factor is difficult to estimate, but in some seasons gluts cause considerable destruction of perishable foodstuffs, and it should therefore be taken into account when using these statistics. The effect of ignoring wastage is ultimately to overstate the consumption figures. In recent years, however, it is likely that there has been less wastage of foodstuffs than previously, because of more efficient methods of distribution and storage (including refrigerated transport, air freight and household refrigeration).

**Additional information.** Additional information related to some of the individual food groups in Tables 1,2 and 3 are set out below:

**Nuts.** Formerly this section contained details on pulse and nuts. However, due to a lack of adequate information estimates on consumption of dried pulse and cocoa have not been calculated in recent years.

**Vegetables.** All vegetables are shown in terms of fresh or fresh equivalent, that is, the statistics in effect relate to the pre-processing stage. For example, the consumption of tomatoes includes fresh tomatoes consumed plus the fresh equivalent of tomatoes consumed as tomato products (canned tomatoes, tomato juice, etc.). Stocks, imports, and exports, of processed tomatoes are converted to fresh equivalent for this purpose.

**Meat.** Owing to diverse cutting practices by butchers in Australia and because of the difficulty of clearly defining the term "retail weight of meat", it is considered impracticable to derive a satisfactory factor for the purpose of expressing estimated meat consumption in terms of retail weight. Depending on cutting practices employed and whether or not bones, etc., sold to customers are included in retail weight of meat, the retail weight as a proportion of carcass weight ranges from about 60 per cent to 75 per cent for beef, from 80 per cent to 95 per cent for mutton and lamb and from 90 per cent to 95 per cent for pork. For this reason apparent consumption of carcass meat is expressed in terms of carcass weight.

**Eggs and egg products.** The production of eggs shown in Tables 2 and 3 is based on Egg Boards' records of output from areas under their control, plus estimates of production for uncontrolled areas and for "back-yard" poultry keepers based on information obtained from other sources. Because of the inadequacy of data

covering the volume of uncontrolled production, the figures should be used with some reserve.

Advances in poultry technology have resulted in a gradual increase in the average weight of eggs produced. For statistical purposes, the average weight of an egg was increased in 1960-61 from 49.6g to 56.7g. Although the increase in average weight actually occurred over a period of years, no adjustment has been made to 1959-60 and earlier years.

*Fish.* For the purpose of estimating supplies of fish available for consumption, in this publication, an allowance of 10 per cent of commercial production has

been made for the non-commercial catch of fish. No such allowances have been made for crustacea or molluscs as it is considered that the non-commercial take is not significant.

*Oils and fats (including butter).* In assessing consumption of all oils and fats no allowance is made for fats consumed in association with carcass meat. The quantities of carcass meat shown in Tables 2 and 3 include fats which remain in the carcass after slaughtering and which may or may not be subsequently removed for boiling down, etc., prior to retailing of the meat. No duplication occurs for fats removed from the carcass at the slaughtering stage.

(a) Flour used for bread making is included in the item "Flour". (b) The general consumption equation has not been used for this item. See paragraph 1, page 4. (c) Comprises output from mills for domestic consumption and imports. (d) Comprises sales and transfers out, adjusted for imports and exports. (e) Includes estimated sugar content of manufactured foods; excludes syrups, honey and glucose. (f) Receivals by the Queensland Peanut Marketing Board. (g) Cold store stocks of apples and pears. (h) Comprises Australian dried fruits deliveries, year ended 30 June, as recorded by the Australian Dried Fruits Association (ADFA). (i) Stocks and commercial production obtained from the ADFA. (j) Stocks held by Egg Boards. (k) Stocks held by the Australian Meat and Livestock Corporation. (l) Comprises salted, dried, smoked and otherwise prepared. (m) Stocks and exports obtained from the Australian Dairy Corporation. (n) Includes butter equivalent of butter oil, butter concentrate and ghee. Comprises domestic sales as recorded by the Commonwealth Dairy Produce Equalisation Committee Ltd. (o) Imports cleared for home consumption. (p) Comprises the quantity of beer removed (duty paid and duty free) for consumption in Australia and imports cleared for home consumption. (q) Comprises the quantity of wholesale sales of wine and imports cleared for home consumption. (r) Comprises the quantity of potable spirits upon which excise duty was paid and imports cleared for home consumption.

(a) Flour used for breadmaking is included in the item "Flour". (b) The general consumption equation has not been used for this item. See paragraph 1, page 4. (c) Comprises output from mills for domestic consumption and imports. (d) Includes estimated sugar content of manufactured foods; excludes syrups, honey and glucose. (e) Receipts by the Queensland Peanut Marketing Board. (f) Cold store stocks of apples and pears. (g) Comprises Australian deliveries, year ended 30 June, as recorded by the Australian Dried Fruits Association (ADFA). (h) Stocks and commercial production obtained from the ADFA. (i) Stocks held by the Australian Meat and Livestock Corporation. (j) Stocks held by Egg Boards. (k) Comprises salted, dried, smoked and otherwise prepared seafood. (l) Stocks obtained from the Australian Dairy Corporation. (m) Includes butter equivalent of butter oil, butter concentrate and ghee. Comprises imports and domestic sales as recorded by the Commonwealth Dairy Produce Equalisation Committee Ltd. (n) Adjusted to include Australian production. (o) Imports cleared for home consumption. (p) Comprises the quantity of beer removed (duty paid and duty free) for consumption in Australia and imports cleared for home consumption. (q) Comprises the quantity of wholesale sales of wine and imports cleared for home consumption. (r) Comprises the quantity of potable spirits upon which excise duty was paid and imports cleared for home consumption.

## II. LEVEL OF NUTRIENT INTAKE

**General notes.** In order to determine whether the quantities of the various foodstuffs available for consumption are likely to be sufficient for adequate nutrition, it is necessary to calculate the amount of nutrients the foods provide.

The analysis in this section is based on the statistics collected by the Australian Statistician as set out elsewhere in this publication and is therefore subject to the same qualifications. See the Explanatory Notes for a statement of these qualifications.

The basis for the calculations of estimated supplies of nutrients available for consumption in Australia was changed after Bulletin No. 23 (1967-68) and is now dependent on conversion factors calculated from *Metric Tables of Composition of Australian Food* (Sucy Thomas and Margaret Corden, A.G.P.S. Canberra, 1977). The previously used Tables, compiled by Anita Osmond and Winifred Wilson, 1954, have been revised and considerably enlarged and nutrient values for almost all food items altered in the light of improved analytical techniques. While comparison with figures published for previous years is no longer entirely valid, the differences in conversion factors are not so great as to negate the value of all such comparisons.

Following a recommendation of the joint FAO-WHO Expert Group which reported on the *Requirements of Vitamin A, Thiamine, Riboflavin and Niacin* (FAO Rome, 1967) the total vitamin A of the diet is now stated as micrograms of vitamin A (retinol) activity. Strict comparisons between vitamin A activity values published since 1968-69 cannot be made with previous values, since the values given for individual food items vary considerably in the food composition tables (1954 and 1977).

**Nutrients available for consumption.** Details of the estimated supplies of nutrients passing into consumption during the years 1974-75, 1975-76 and 1976-77 are shown in Table 4. Data for previous years and for other countries are given in Tables 7 and 10 respectively.

Losses due to processing have been allowed for by way of an adjustment to the conversion factors used for processed and preserved foods. No allowances have been made for losses of nutrients (other than vitamins) due to the effect of storage and cooking; losses of vitamins are referred to in the following paragraphs. The figures in Tables 7-9 are adjusted for losses of vitamins in cooking and for the additional niacin obtained from the metabolism of protein (see Table 5 for these adjustments).

**Loss of vitamins in cooking.** As a result of storage and cooking, certain foods, particularly fruit and vegetables, lose some of their nutritive value. Estimates of possible loss of vitamin C (ascorbic acid) and thiamin in cooking are set out in Table 5. Losses in cooking of other nutrients do occur but not in amounts likely to be significant. Losses due to storage have not been estimated.

Losses of vitamin C cover a wide range, from almost nil to 100 percent. On average, 60 percent of vitamin C in leafy green vegetables is lost through cooking, while losses for skinned potatoes, other vegetables and stewed fruit are approximately 50 percent. There is also a significant loss of thiamin in the cooking of meat and vegetables, the amount of loss depending on the method and duration of cooking. In a normal mixed diet it is accurate enough for statistical purposes to allow 15 per cent deduction from the total thiamin available. The estimates in Table 5 are calculated assuming average conditions and methods of cooking. Losses could be reduced to less than these figures by careful cooking. Losses from uncooked fruits and vegetables are assumed to be negligible.

(a) Not comparable with years prior to 1968-69. Figures are based on conversion factors calculated from the revised and enlarged edition of S. Thomas and M. Corden *Metric Tables of Composition of Australian Food* A.G.P.S., Canberra 1977. See notes, page 16. (b) Micrograms (kg). One international unit of vitamin A is equivalent to 0.3 microgram.

**Dietary allowances.** The nutritive value of food available for consumption may be compared with some arbitrary standard such as the *Dietary Allowances for use in Australia (1970 Revision)*, formulated by the Nutrition Committee of the National Health and Medical Research Council. This comparison has been made in Table 9 (in conjunction with Table 8), where the quantity of nutrients available for consumption in the Australian diet (as shown in Table 4), less estimated cooking loss, is compared with desirable quantities recommended by the Council. The allowances shown in Table 8 are averages weighted according to the various age groups in the population. The allowance data are based on information from the publication *Estimated Age Distribution of the Population, States and Territories of Australia*, (3201.0).

The comparisons in these tables are useful as an indication of trends in food consumption, although it must be emphasised that the allowances do not necessarily represent nutrient requirement; rather they

were devised for the planning of practical diets within the average Australian food pattern. Precise information concerning human requirements of certain nutrients is far from complete, and no conclusion regarding the nutritional status of the community should be drawn from comparison with these allowances. A deviation from the allowances of the order of 10-15 per cent is not regarded as a serious deficiency. Even if the nutrient intake is more than 15 per cent below the allowance, a nutritional deficiency cannot be assumed without clinical verification.

The calculated figures, being averages, give no information on the food consumption of individuals or of specific groups within the population. Also the figures represent food available for consumption, which is not the same as foods consumed. The Food and Agriculture Organisation of the United Nations estimates that in communities with a plentiful food supply, up to 15 per cent of the food available may be wasted.

TABLE 8. DIETARY ALLOWANCES OF NUTRIENTS : AUSTRALIA (a)  
(Per head per day)

Nutrient	Unit	1973-74	1974-75	1975-76	1976-77
Protein	g	59.42	59.52	59.59	59.69
Calcium	mg	438.14	437.53	437.14	436.68
Iron	mg	10.40	10.41	10.43	10.44
Vitamin A activity	µg	673.12	674.24	675.27	676.64
Vitamin C	mg	31.83	31.83	31.84	31.82
Thiamin	mg	0.85	0.85	0.85	0.85
Riboflavin	mg	1.07	1.07	1.07	1.07
Niacin equivalent	mg	14.00	14.01	14.02	14.03
Energy value	{ kcal kJ	2,128 8,907	2,131 8,919	2,133 8,927	2,134 8,933

(a) Source: S. Thomas and M. Corden *Metric Tables of Composition of Australian Food*, A.G.P.S., Canberra, 1977. Appendix 1. The allowances are averages weighted according to various age groups in the population; the age distributions at the beginning of each period have been used.

TABLE 9. NUTRIENTS AVAILABLE FOR CONSUMPTION, COMPARED WITH DIETARY ALLOWANCES : AUSTRALIA

Nutrient	Unit	Nutrients available (per head per day)				Nutrients expressed as percentage in excess of dietary allowances (%)			
		1973-74	1974-75	1975-76	1976-77	1973-74	1974-75	1975-76	1976-77
Protein	g	93.5	101.8	103.3	100.7	57.4	71.0	73.4	68.6
Calcium	mg	962.7	972.2	923.6	859.2	119.7	122.2	111.3	96.8
Iron	mg	13.4	15.2	15.7	15.7	28.9	46.0	50.5	49.3

(a) Data not adjusted for cooking losses and increased niacin. (b) Source: Departments of Trade, Prices and Consumer Protection, *Trade and Industry*, H.M.S.O., London. (c) Source: Economics, Statistics and Cooperative Service, *National Food Review*, US Department of Agriculture, Washington. (d) Not comparable with years prior to 1968-69. Figures are based on conversion factors calculated from S. Thomas and M. Corden, *Metric Tables of Composition of Australian Food*, A.G.P.S., Canberra 1977.

Note. Owing to the differences in the bases of calculating consumption and the use of different nutrient conversion factors, figures for the countries shown are not strictly comparable.
