## Release date for December Quarter 1992 issue

The September quarter 1992 issue of *Australian National Accounts: Gross Product, Employment and Hours Worked* (5222.0) is the final issue of that publication. In future, the estimates presented in 5222.0 will be released with the national income and expenditure estimates in the renamed publication *Australian National Accounts: National Income, Expenditure and Product* (5206.0). The December quarter 1992 issue of 5206.0 is expected to be released on Thursday, 18 March 1993.

## *Foreword*

*Three alternative estimates of gross domestic product (GDP) are produced each quarter. Two of them (income-based and expenditure-based, referred to as GDP(I) and GDP(E), respectively) are the subject of this publication, while the third one (production-based, referred to as GDP(P) and derived from production measures for each industry) is detailed in Australian National Accounts: Gross Product, Employment and Hours Worked (5222.0). A fourth measure of GDP calculated as the average of the first three, is referred to as GDP(A).*

*Commencing with the December quarter 1992 issue the ABS will combine the two quarterly national accounts publications. The new publication will be entitled Australian National Accounts : National Income, Expenditure and Product, and will retain the Catalogue Number 5206.0.*

*Analysis undertaken in 1990 suggested that, historically, GDP(A) has provided the most satisfactory indicator of short-term seasonally adjusted or trend growth (for extra details, see the Feature Article in the June quarter 1990 issue of Australian National Accounts: National Income and Expenditure (5206.0)). More information on the relationships between the various estimates of GDP is presented in the Notes on the Estimates.*

*The preferred current price measure of GDP is GDP(I). It is the overall measure which is consistent with subsidiary measures such as national income and the other consolidated tables (such as the national income and outlay account). GDP(I) also provides the base year benchmarks for the constant price estimates of GDP(P). In addition GDP(I) has traditionally been the most prominent and commonly-used constant price estimate.*

## SUMMARY MEASURES OF GROSS DOMESTIC PRODUCT

*Care must be taken in interpreting the quarterly national accounts estimates for the later quarters which may be substantially revised as more complete data become available.*

*Unless otherwise stated, the comments that follow each table relate to constant price estimates.*

### PERCENTAGE CHANGE IN GROSS DOMESTIC PRODUCT AT AVERAGE 1984-85 PRICES (a)

	Seasonally adjusted		Trend	
	June qtr 1992	Sept qtr 1991	June qtr 1992	Sept qtr 1991
	to	to	to	to
	Sept qtr 1992	Sept qtr 1992	Sept qtr 1992	Sept qtr 1992
<b>Gross domestic product (GDP) :</b>				
GDP (A) - Average	0.5	2.1	0.5	1.9
GDP (I) - Income-based	0.3	2.4	0.4	2.1
GDP (E) - Expenditure-based	0.5	1.7	0.3	1.3
GDP (P) - Production-based	0.8	2.1	0.8	2.3
<b>Gross non-farm product (GNFP) :</b>				
GNFP (A) - Average	0.3	2.0	0.4	1.9
GNFP (I) - Income-based	0.1	2.3	0.3	2.1
GNFP (E) - Expenditure-based	0.2	1.6	0.2	1.4
GNFP (P) - Production-based	0.6	2.0	0.7	2.3

(a) Analysis suggests that historically the average of the three measures of gross domestic product, GDP(A), provides the most satisfactory indicator of short-term growth.

- The trend estimate of GDP(A) increased by 0.5 per cent in the September quarter 1992;
  - the growth recorded in September quarter follows an increase of 0.5 per cent in June quarter 1992;
  - the trend estimate of GDP(A) has increased by 1.9 per cent since the September quarter last year;
  - the trends of all three independent measures of GDP (I, E and P) have shown modest growth over the last four quarters;
  - the trend growth in GDP(A) per capita has increased marginally during the last three quarters, after declining for the previous two years.
- In seasonally adjusted terms, the movements in GDP(A) over the last three quarters are very similar to those of the trend estimates, with consecutive percentage movements of 0.4, 0.6 and 0.5 in the three quarters to September 1992, but there is more diversity among the movements of the independent measures;
  - in the September quarter 1992 GDP(I) grew by 0.3 per cent, GDP(E) grew by 0.5 per cent and GDP(P) increased by 0.8 per cent.
- The seasonally adjusted estimate of the average of the three gross non-farm product estimates (GNFP(A)) increased by 0.3 per cent in the September quarter 1992, following growth of 0.6 per cent in the June quarter 1992.

## MAIN FEATURES OF EXPENDITURE AND INCOME COMPONENTS

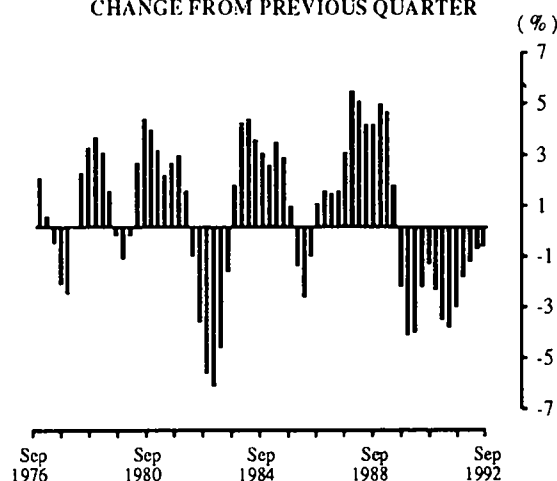

## EXPENDITURE COMPONENTS AT AVERAGE 1984-85 PRICES

	Quarterly percentage change				Percentage points contribution to growth in seasonally adjusted GDP(I)	
	Seasonally adjusted		Trend			
	June 1992	Sept 1991	June 1992	Sept 1991	June 1992	Sept 1991
	to Sept 1992	to Sept 1992	to Sept 1992	to Sept 1992	to Sept 1992	to Sept 1992
Final consumption expenditure -						
Private	—	2.7	0.5	3.0	—	1.7
Government	1.9	2.2	0.5	1.8	0.4	0.4
Gross fixed capital expenditure						
Private	-2.1	-5.3	-0.7	-4.7	-0.3	-0.8
Public	2.7	5.8	1.5	2.1	0.2	0.3
Increase in stocks -						
Private non-farm	..	..	..	..	0.5	0.8
Farm and public authority	..	..	..	..	0.6	0.6
Statistical discrepancy	..	..	..	..	-0.1	0.7
Gross national expenditure	1.2	3.8	0.8	3.4	1.2	3.8
Exports of goods and services	-1.1	4.1	1.6	4.8	-0.3	0.9
Imports of goods and services	2.4	10.6	3.5	11.0	-0.5	-2.3
Gross domestic product (I)	0.3	2.4	0.4	2.1	0.3	2.4
Gross farm product	6.2	4.7	2.8	0.6	0.2	0.2
Gross non-farm product (I)	0.1	2.3	0.3	2.1	0.1	2.3
Gross domestic product (E)	0.5	1.7	0.3	1.3	0.5	1.7

Unless otherwise stated, the following comments are based on seasonally adjusted constant price estimates.

- **Private final consumption expenditure** was flat in the September quarter;
  - increases were recorded for purchase of motor vehicles (up 2.2 per cent), fares (up 1.7 per cent) and household durables (up 1.6 per cent);
  - there were decreases in cigarettes and tobacco (down 3.8 per cent), clothing footwear and drapery (down 3.5 per cent) and operation of motor vehicles (down 1.2 per cent).
- **Government final consumption expenditure** rose by 1.9 per cent in September quarter 1992.
- **Public gross fixed capital expenditure** rose by 2.7 per cent in September quarter 1992. Both general government and public enterprises recorded increases (up 2.9 per cent and 2.5 per cent respectively);
  - purchases of aircraft by Commonwealth public enterprises remained at a high level (\$356 million in both June and September quarters in original constant price terms) and had no impact on the overall movement in September.
- There was a rundown of \$24 million in **private non-farm stocks** in September quarter 1992 following an even larger rundown in the June quarter of \$345 million. Consequently there was a small positive contribution to growth in GDP;
  - the only industry to record a rundown in stocks was manufacturing (its tenth successive quarterly decline);
  - the retail industry recorded a build-up following a large rundown in the June quarter.
- **Exports of goods and services** fell by 1.1 per cent in the September quarter;
  - the decline was mainly attributable to falls for gold and coal, coke and briquettes.
- **Imports of goods and services** rose by 2.4 per cent in September quarter 1992;
  - fuel (up 32.9 per cent) was largely responsible for the overall growth and outweighed a fall of 14.2 per cent in transport equipment.
- **Private gross fixed capital expenditure** fell by 2.1 per cent in the September quarter;
  - dwellings continued to improve (up 5.0 per cent), with a 9 per cent increase in the new dwelling component partially offset by a decline in alterations and additions;
  - non-dwelling construction fell by 7.4 per cent - the new capital expenditure component was down by 2.9 per cent and there was a large fall in net purchases of assets from the public sector;
  - equipment fell by 4.1 per cent mainly reflecting a fall of 5.2 per cent in new capital expenditure.

TREND ESTIMATE  
CHANGE FROM PREVIOUS QUARTER

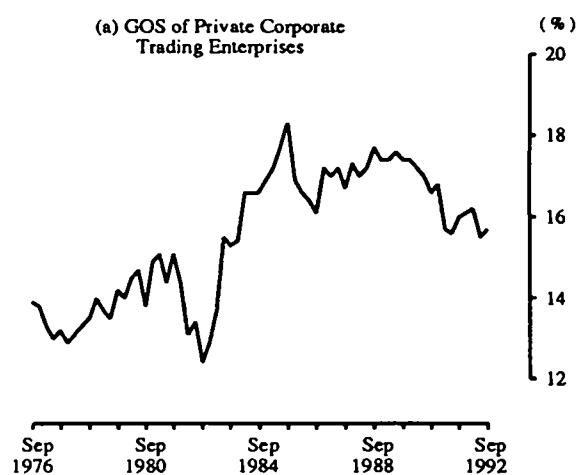

## INCOME COMPONENTS AT CURRENT PRICES - SEASONALLY ADJUSTED

	Percentage change		Percentage points contribution to growth in GDP (I)	
	June qtr 1992	Sept qtr 1991	June qtr 1992	Sept qtr 1991
	to Sept qtr 1992	to Sept qtr 1992	to Sept qtr 1992	to Sept qtr 1992
Wages, salaries and supplements	1.3	2.8	0.7	1.4
Gross operating surplus				
Trading enterprises				
Private corporate	2.3	1.5	0.3	0.2
Other	1.3	5.2	0.3	1.2
Other	..	..	—	0.1
Indirect taxes less subsidies	-1.3	3.3	-0.1	0.4
Gross domestic product (I)	1.1	3.3	1.1	3.3

WAGES SHARE OF GDP(I) AT FACTOR COST  
Current prices, seasonally adjusted

PROFIT(a) SHARE OF GDP(I) AT FACTOR COST  
CURRENT PRICES, SEASONALLY ADJUSTED

- Seasonally adjusted wages, salaries and supplements increased by 1.3 per cent during September quarter in current price terms, reflecting rises of about 0.7 per cent in both underlying average earnings and the number of wage and salary earners.

- In seasonally adjusted current price terms, the gross operating surplus of private corporate trading enterprises rose by 2.3 per cent in the September quarter 1992 following a fall of 5.0 per cent in June quarter 1992.

## NOTES ON THE ESTIMATES

### Alternative measures of gross domestic product

There are three approaches which can be used to measure gross domestic product (GDP):

- the *income approach*, GDP(I);
- the *expenditure approach*, GDP(E); and
- the *production approach*, GDP(P).

In concept, the three measures are identical but, in practice, they can differ significantly, particularly in the short term. The main reason for the differences is that different data sources are used for each of the three approaches. Detailed quarterly estimates of GDP(I) and of GDP(E) at constant prices are provided in this publication. Quarterly estimates of GDP(P) at constant prices by industry are published in *Australian National Accounts: Gross Product, Employment and Hours Worked* (5222.0).

Traditionally, the income-based estimate (ie, GDP(I)) had been the most prominent and commonly used estimate of GDP at constant prices. However, the ABS considers that a smoother and better indicator of short-term movement in GDP can be derived by taking a simple average of the three measures to obtain GDP(A). An article outlining a statistical analysis of the short-term movements of the three measures of GDP and their average appeared in the June quarter 1990 issue of *Australian National Accounts: National Income and Expenditure* (5206.0).

The following table provides a comparison of quarterly movements in recent years using each approach.

PERCENTAGE CHANGES IN GDP  
AT AVERAGE 1984-85 PRICES  
SEASONALLY ADJUSTED

Period	GDP(A)	GDP(I)	GDP(E)	GDP(P)
1989-90				
Dec	-0.2	-0.4	-0.4	0.3
Mar	1.3	1.9	0.7	1.4
June	-0.4	-0.1	-0.2	-1.0
1990-91				
Sept	-1.1	-1.2	-0.9	-1.2
Dec	0.1	0.1	1.1	-0.8
Mar	—	0.1	0.4	-0.6
June	-0.6	-0.8	-0.7	-0.2
1991-92				
Sept	-0.1	-0.5	0.4	-0.1
Dec	0.6	0.9	1.2	-0.3
Mar	0.4	0.8	-0.6	0.9
June	0.6	0.3	0.6	0.7
1992-93				
Sept	0.5	0.3	0.5	0.8

### Trend estimates

A trend estimate is obtained by removing the irregular component from the seasonally adjusted series. In practice, it is calculated for estimates in this publication by applying a centred 7-term Henderson moving average to the seasonally adjusted series. Estimates for the three

most recent quarters cannot be calculated by this method and an asymmetric average is used instead, which can lead to revisions in the last three quarters when data become available for later quarters.

### Implicit price deflator (IPD) for GDP(I)

The IPD for GDP(I) increased by 0.8 per cent in the September quarter, following a fall of 0.9 per cent in the previous quarter. Both these movements were due mainly to the effect of compositional change. In contrast, the corresponding fixed-weighted index, which is unaffected by compositional change, increased by 0.1 per cent in the June quarter and 0.4 per cent in the September quarter.

### Adjustments to private final consumption expenditure (PFCE) source data

#### Adjustments to retail trade, Queensland

Estimates of turnover of retail establishments published in *Retail Trade, Australia* (Cat No 8501.0) provide the major data source for PFCE on goods other than motor vehicles, petroleum, and cigarettes and tobacco. As a first step in deriving PFCE estimates the *turnover* in each State and industry is adjusted to a *retail sales* basis consistent with the 1985-86 Retail Census benchmarks.

In February 1992 Queensland hotels and clubs began introducing poker machines. Since then the gross margins from poker machines have been reported by respondents in the *Hotels, liquor stores, licensed clubs* industry. While there does not appear to be a noticeable impact on turnover in the months immediately after February, the Queensland estimates for the three months to September seem to be higher than might otherwise have been expected.

Poker machine profits are already included within the gambling component of the PFCE item *Entertainment and recreation*. In order to avoid double counting this expenditure the Queensland turnover for *Hotels, liquor stores, licensed clubs* has been lowered by \$50 million in the September quarter before being used to derive the PFCE estimates.

Due to this adjustment the retail goods component of the Queensland series in Tables 36 to 39 has a somewhat smaller movement between the June and September quarters of 1992 than implied by the estimates published in 8501.0.

#### Adjustments to purchase of motor vehicles

*Motor Vehicle Registrations, Australia* (Cat No 9303.0) is a major data source for estimating household purchases of motor vehicles. Consequently, there is generally a close correlation between movements in the number of passenger vehicles registered and the corresponding movements in constant price estimates of private final consumption expenditure on purchase of motor vehicles.

As noted in the January 1992 issue of ABS Catalogue No 9303.0, processing delays in New South Wales resulted in a substantial number of December 1991 registrations being recorded in the January 1992 estimates. In order to reflect actual expenditures, the initial current price estimates based on published registration numbers have been adjusted by shifting \$60 million from the March

quarter 1992 back into the December quarter 1991. For this reason, the March quarter 1992 rise of 8.9 per cent in the national accounts estimates (at constant prices and seasonally adjusted, as shown in Table 21) is noticeably less than the increase of 13.1 per cent in seasonally adjusted passenger vehicle registrations (January-March 1992 compared with October-December 1991).

The relationship between movements in the two sets of estimates between the March and June quarters of 1992 is affected by three factors.

First, the starting point in the March quarter is lower in the national accounts estimates due to the adjustment described above.

Second, a further problem occurred with the June 1992 registrations recorded for New South Wales in 9303.0. The introduction in June of on-line computer processing captured all June registrations as well as the backlog associated with processing delays in the previous system. In order to ensure that the quarterly movements for March to June 1992 and June to September 1992 are not distorted, a one-off adjustment has been made in the national accounts to reduce the June quarter registrations by 4,000 passenger vehicles, equivalent to \$80 million in original current price terms.

Third, business vehicles accounted for a higher proportion of total registrations in the June quarter than in the March quarter. As a result, the movement in household purchases during the June quarter is less than the movement in total registrations.

While each of these factors is significant in its own right they roughly cancel out overall: constant price estimates of PFCE on purchase of motor vehicles fell 6.2 per cent in seasonally adjusted terms during the June quarter, compared with a fall of 5.4 per cent in seasonally adjusted registrations of passenger vehicles as shown in 9303.0. The same comparison in September quarter shows a rise of 2.2 per cent in PFCE as against a fall of 0.5 per cent in new registrations.

### Gross farm product

Gross farm product rose 6.2 per cent in seasonally adjusted constant price terms in the September quarter 1992. There were substantial rises in seasonally adjusted production of wheat and sugar, partially offset by a fall in other non-grain crops, particularly cotton. There was very little change in livestock slaughterings, other livestock products and other grain crops. Farm inputs rose by 0.3 per cent over the June quarter in seasonally adjusted constant price terms.

It should be noted that the convention used to seasonally adjust wheat, sugar cane, other cereals and other crops has particular implications for the interpretation of quarter-to-quarter change in seasonally adjusted gross farm product. The method used is to divide the annual production of these crops by four. Although this avoids problems that would be associated with the application of standard methods of seasonal adjustment to the production of these crops, it does have the effect of concentrating the whole of

the annual change into the September quarter, followed by zero growth in December, March and June quarters. As an example the expected increase in the annual wheat crop contributed 6.9 percentage points to the growth in seasonally adjusted constant price gross farm product in the September quarter, but will not contribute to growth in the following three quarters. (A more detailed description of the seasonal adjustment of gross farm product is provided on page 8 of the December quarter 1991 issue of 5206.0, and in Appendix 1 of *Australian National Accounts: Concepts, Sources and Methods* (5216.0).)

### Private gross fixed capital expenditure - non-dwelling construction and equipment

In recent years there have been several significant transactions in second-hand assets between the private and public sectors. Details are provided in the following tables of new work done on private non-dwelling construction and purchases of new items of equipment.

#### PRIVATE GROSS FIXED CAPITAL EXPENDITURE NON-DWELLING CONSTRUCTION AT AVERAGE 1984-85 PRICES (\$ million)

**Stocks to sales ratio**

**RATIO OF PRIVATE NON-FARM STOCKS TO SALES  
AT AVERAGE 1984-85 PRICES  
SEASONALLY ADJUSTED**

In seasonally adjusted constant price terms, *private non-farm stocks* were run down by \$24 million (0.1 per cent)

during September quarter 1992, while sales (see paragraph 22 of the 'Explanatory Notes') decreased by \$220 million (0.3 per cent). Consequently, the stocks to sales ratio increased marginally from 0.502 to 0.503. The preceding graph presents this ratio from September quarter 1976 onwards.

**Exports of goods and services**

Constant price estimates of exports of goods and services fell by 1.1 per cent in seasonally adjusted terms in the September quarter 1992. An increase in *rural exports* (up 1.6 per cent) was offset by a fall in *non-rural exports* (down 2.6 per cent). The increase in *rural exports* was largely due to a substantial increase in *sugar*. The major contributors to the fall in *non-rural exports* were *gold and coal, coke and briquettes* (down 11.4 per cent and 8.4 per cent respectively) both of which had risen to very high levels in the June quarter 1992.

The implicit price deflator (IPD) for exports of goods and services rose by 3.4 per cent in September quarter 1992. Prices increased for most commodity groupings. The fixed weighted index (FWI) increased by 2.4 per cent. The difference between the movements in the IPD and the FWI is due to compositional change.

**Imports of goods and services**

In seasonally adjusted constant price terms imports of goods and services rose by 2.4 per cent in September quarter 1992. A significant increase of 32.9 per cent was recorded for *fuels* but this was offset to some extent by a 14.2 per cent fall in *transport equipment*.

The IPD for imports of goods and services rose by 4.8 per cent. All categories of imports recorded higher prices in September quarter, reflecting the devaluation of the \$A during the quarter. The most significant increases were those recorded for *fuels* (up 14.0 per cent) and *machinery* (up 12.1 per cent). The fixed weighted index for imports of goods and services increased by 4.7 per cent.

**Imports to sales ratio**

The imports to sales ratio (see paragraph 23 of the 'Explanatory Notes') remained unchanged at 0.134 in September quarter 1992. There was a decline of 0.3 per cent in endogenous imports and a comparable decrease in sales, both measured in seasonally adjusted constant price terms.

**RATIO OF IMPORTS TO SALES  
AT AVERAGE 1984-85 PRICES  
SEASONALLY ADJUSTED**

### Terms of trade

Initial estimates indicate that Australia's terms of trade declined 1.2 per cent in September quarter 1992, reflecting the combined effect of rises of 3.4 per cent in export prices and 4.8 per cent in import prices. The terms of trade since September quarter 1976 are shown in the following graph.

**TERMS OF TRADE**  
(1984-85 = 100)  
SEASONALLY ADJUSTED

### Gross domestic product (GDP) adjusted for terms of trade effect.

Changes in the aggregate *gross domestic product at constant prices* provide an indication of the volume of goods and services produced in Australia. If, however, the terms of trade have changed significantly over the period of comparison, then this aggregate will not provide an accurate reflection of the changes in the real purchasing power of the income generated by domestic production. A detailed description of the terms of trade effect was included in the *Notes on the estimates* section of the December quarter 1990 issue of this publication.

The following graph shows constant price GDP before and after adjustment for the terms of trade effect.

**GDP(I) AT AVERAGE 1984-85 PRICES**  
(ADJUSTED FOR TERMS OF TRADE EFFECT)  
SEASONALLY ADJUSTED

### Household saving ratio

Present estimates indicate that, on a seasonally adjusted basis, the proportion of household disposable income devoted to consumption in the September quarter was 92.9 per cent while *household saving*, which is derived as a balancing item, represented 7.1 per cent.

The *household saving ratio* is affected by any deficiencies or inconsistencies in the estimation and seasonal adjustment of household income and expenditure. Particular caution should be exercised in interpreting this ratio for recent years, and especially for the most recent quarter, because major components may still be subject to significant revisions. The impact of such revisions on the saving ratio can be quite marked and can cause changes in the apparent direction of the trend.

The following graph presents this ratio from September quarter 1976 onwards.

**HOUSEHOLD SAVING RATIO**  
SEASONALLY ADJUSTED

### Revisions in this issue

#### Seasonal reanalysis

The seasonal factors for the following series have been changed since the June quarter 1992 issue of this publication:

- Wages, salaries and supplements;
- Commonwealth government final consumption expenditure;
- State and local government final consumption expenditure;
- Current grants to non-profit institutions.

#### Other revisions

The major reason for revisions to the current price estimates in this publication is the availability of more complete ABS survey data. Revisions to the income aggregates *wages, salaries and supplements* and *gross operating surplus of corporate trading enterprises*, in the

March and June quarters 1992 were largely offsetting so that only small revisions have been made to current price GDP(I).

Private gross fixed capital expenditure on non-dwelling construction in June quarter 1992 was revised up by \$367 million (only very preliminary data were available from the Building Activity Survey and the Engineering Construction Survey when the accounts for June quarter were compiled).

Estimates for private gross fixed capital expenditure on equipment and increase in private non-farm stocks were revised from September quarter 1990 and September quarter 1989, respectively, as a result of improvements made to the frameworks for the surveys being used to compile estimates for these aggregates. These revisions affected levels but generally had little impact on individual quarterly movements.

## EXPLANATORY NOTES

### Introduction

This publication provides estimates of the components of gross domestic product and national expenditure and supporting tables for the September quarter 1992, together with comparative estimates for the eight previous quarters and the four years 1988-89 to 1991-92. In addition, seasonally adjusted estimates of the major aggregates and some selected series are provided for the September quarter 1992, together with comparative estimates for the twelve previous quarters. Tables 42-47 show revisions that have been made to major aggregates since the previous publication. Tables 48-56 provide time series, in both original and seasonally adjusted terms, for the period from September quarter 1979 for the aggregates contained in the domestic production account (at both current and average 1984-85 prices), some income aggregates, implicit price deflators and some other selected series.

### Concepts, definitions, sources and methods

2. An expanded version of *Australian National Accounts: Concepts, Sources and Methods* (5216.0) was released in 1990. It outlines major concepts and definitions, describes sources of data and methods used to derive annual and quarterly estimates for major aggregates at both current and constant prices and discusses the accuracy and reliability of the national accounts. In addition it includes documentation on input-output tables, flow of funds tables, capital stock and State accounts.

### Interpretation of quarterly estimates

3. Estimating for a period of less than one year presents special problems in that it is often difficult to adhere strictly to the definitions and concepts used in annual estimates. The measurement of income for a quarterly period is particularly difficult since it is not always possible to match the value of production for a quarter with the cost incurred in that production. This problem occurs, for example, in estimating the income of farm unincorporated enterprises in each quarter and results in considerable variation in estimates for this series, and for gross farm product, from quarter to quarter. Difficulties are also experienced in obtaining detailed data for short periods and in preparing consistent estimates from various sources where different accounting procedures and periods are used.

4. These problems inevitably affect the consistency and reliability of the current price estimates, and similarly affect the constant price estimates based on the current price estimates. Accordingly, these factors as well as the approximations and assumptions necessarily made in the revaluation of flows to constant prices should be taken into account when interpreting or using the estimates (for example, in attempting to draw precise quantitative inferences relating to quarter-to-quarter changes in gross domestic product or its components, or in measuring productivity).

5. Analysis of trends requires allowance for these uncertainties in estimation. To some extent, the effects are indicated by the changes in the statistical discrepancy for corresponding periods. Uncertainty in trends arises also from the likelihood of revisions as more information becomes available and from the irregularity of short-term movements. The inclusion of the statistical discrepancy on the expenditure side of the accounts is a convention and does not necessarily imply that the sum of income components more accurately measures GDP than the sum of the expenditure components (plus exports less imports). As household and other saving are estimated as balancing items in their respective accounts, care should be exercised in their interpretation.

6. Estimates of national income and expenditure are necessarily prepared from a wide range of statistical information, some of which is available quickly and some only with a delay of several years. For this reason most figures should be regarded as subject to revision as more complete and more accurate information becomes available. The revisions will be of two main types - those made to the most recent quarters as firmer quarterly or monthly data come to hand and those which are a consequence of revisions to annual totals and distributed to the quarters approximately in accordance with existing quarterly patterns.

7. No simple measure is available of the accuracy of the major summary national accounting aggregates. However, the following example illustrates the *sensitivity* of quarter-to-quarter growth to the timing of recording a transaction. If, in the latest year, the timing of recording a transaction were delayed by one quarter and if the transaction had an impact on constant price gross domestic product of +\$65 million then the measure of the rate of growth would be affected in the three adjoining quarters (centred on the quarter in which the transaction was recorded) by -0.1, +0.2, and -0.1 percentage points respectively. Of course the percentage impact of such a timing delay on relevant sub-aggregates would be greater.

8. The quarterly implicit price deflators (IPDs) shown in Table 11 are derived by dividing seasonally adjusted current price estimates by the corresponding seasonally adjusted constant price estimates. Movements in the levels of individual implicit price deflators can be greatly affected by changes in the physical composition of the aggregates and their components. Generally, it is considered that IPDs derived from seasonally adjusted data are more reliable than those obtained by using original (i.e. unadjusted) series, because the former are less likely to be affected by compositional change than are the latter. However the seasonal adjustment process is itself a source of possible distortion, especially to the extent that it is not possible to identify, in a fully consistent way, the seasonality of the current price estimates and of the constant price estimates. A discussion of the limitations involved in using IPDs as measures of pure price change is contained in Appendix VI of *Australian National Accounts: Concepts, Sources and Methods* (5216.0).

### Seasonal adjustment

9. As most series are affected to some extent by seasonal factors, allowance should be made for normal seasonal variation. In a number of tables, *seasonally adjusted* values are presented for selected series. Series which show substantial irregularities in the original or adjusted series should be treated with some reserve. As different methods of seasonal adjustment tend to produce different results, it is necessary to take into account the methods by which seasonally adjusted estimates have been derived and the limitations to which those methods are subject. It should also be noted that the methods of seasonal adjustment used by the ABS do not force the sum of the seasonally adjusted estimates for each quarter of a financial year to equal the original annual total.

10. The general methods used for making seasonal adjustments in the national accounts are described in Appendix I of *Australian National Accounts: Concepts, Sources and Methods* (S216.0). However, special methods have been used to adjust some of the components of gross farm product which are not amenable to seasonal adjustment by the usual methods. These concern the adjustment of crop production. The output of crops is considered to take place when each crop is harvested. As the harvesting of crops such as wheat, barley or sugar is concentrated in a couple of quarters each year, standard methods of seasonal adjustment cannot be applied satisfactorily. The method adopted is to distribute the output for each financial year (expected output in the latest year) equally over the four quarters. Thus, in seasonally adjusted terms, the output of crops is a step function in which quarterly movements can only occur between June and September quarters.

11. Where there is no apparent seasonality in their implicit price deflators, constant price estimates are seasonally adjusted using the same factors as are used for adjusting the corresponding current price estimates. As far as possible the remaining constant price estimates have been adjusted using methods similar to those for corresponding current price estimates.

12. Seasonally adjusted estimates of private final consumption expenditure for each State and Territory at current and average 1984-85 prices are shown in Tables 37 and 39 of this publication. Due to the relatively short span of data available for analysis, no State-specific Easter or trading-day correction factors have been able to be applied in the seasonal adjustment of these series (see page 8). The State and Territory series have been adjusted at a more aggregated level than the Australian series and independently of them (although as far as possible similar methods have been used). For these reasons the sum of the seasonally adjusted State and Territory series do not generally equal the seasonally adjusted Australian series.

### Trend estimates

13. Trend estimates of GDP(I), its expenditure components and other selected aggregates are presented in Table 5. They have been derived by applying a 7-term Henderson moving average to the quarterly seasonally

adjusted constant price estimates. The weights of the 7-term average are as follows: -0.059, 0.059, 0.294, 0.412, 0.294, 0.059, -0.059.

14. As a moving average approaches the end of a time series and begins to run out of observations, asymmetric averages have to be used. Unlike the asymmetric weights of the standard 5-term and 7-term Henderson moving averages, the weights employed here have been tailored to suit the particular characteristics of GDP and GNFP.

15. Users may wish to refer to the ABS Information Papers *A Guide to Smoothing Time Series - Estimates of 'Trend'* (1316.0) and *Time Series Decomposition - An Overview* (1317.0) for more detailed information on smoothing seasonally adjusted time series data.

### Analysis of contributions to growth table

16. Table 3 presents an analysis of the contribution provided by each major aggregate to the percentage change in seasonally adjusted gross domestic product at constant prices. The formula used to calculate the contribution of each aggregate to the growth in GDP is:

$$\frac{A(t) - A(t-1)}{GDP(t-1)} \times 100.0$$

where A(t) = value of aggregate A in quarter under consideration

A(t-1) = value of aggregate A in preceding quarter

GDP(t-1) = value of GDP in preceding quarter.

All these values are seasonally adjusted constant price estimates. It should be noted that the figures in this table are additive within each quarter, unlike the percentage changes shown in other tables in this publication.

### Terms of trade

17. There are several ways of measuring the terms of trade. A common means of doing so is by calculating an index of the form:

$$\frac{\text{Price index of exports}}{\text{Price index of imports}} \times 100.0$$

18. In this publication the price indexes used in calculating the terms of trade are the implicit price deflators for exports of goods and services and for imports of goods and services. They take into account not only the changes in the prices of exports and imports, but also the effects of changes in the composition of exports and imports on total recorded price movements. The terms of trade is presented as a memorandum item in Tables 4 and 11.

### Gross domestic product (GDP) at constant prices, adjusted for the terms of trade

19. Changes in the aggregate 'gross domestic product at constant prices' provide an indication of changes in the volume of goods and services produced within Australia.

If, however, the terms of trade have changed significantly over the period of comparison this aggregate will not provide an accurate reflection of the change in the real purchasing power of the income generated by domestic production.

20. As with the terms of trade, no single agreed measure of the effect of the terms of trade on movements in GDP at constant prices is available, and the available methods will generally produce different results.

21. In this publication the adjustment has been calculated by first revaluing exports of goods and services by the implicit price deflator of imports of goods and services (thereby providing a measure of the purchasing power of exports over imports). The actual constant price value of exports of goods and services has then been deducted from this value to provide the terms of trade adjustment which has been added to GDP(I) at constant prices to obtain the required result. The series is presented as a memorandum item in Tables 2, 5, 6 and 10.

#### Private non-farm stocks to sales ratio

22. The denominator of this ratio is defined as gross non-farm product(I) *plus* endogenous imports (imports of goods *excluding* imports of fuel, imports of certain large items of equipment by both the public and private sectors and certain other government imports) *plus* imports of services *less* changes in private non-farm stocks. All of these variables are at constant prices. The ratio is presented as a memorandum item in Table 10.

#### Imports to sales ratio

23. The ratio is endogenous imports to sales (both as defined for the private non-farm stocks to sales ratio - see paragraph 22). It is presented as a memorandum item in Table 10.

#### Household saving ratio

24. This is defined as the ratio of household saving to household disposable income, where household saving is a balancing item derived as the difference between household disposable income and private final consumption expenditure. The ratio is presented as a memorandum item in Table 25.

#### GDP(A) per capita

25. This is the ratio of GDP(A) to an estimate of the resident Australian population. For all but the most recent quarters, the resident population data are drawn from *Australian Demographic Statistics* (3101.0). Estimates for the most recent quarters are derived by a simple extrapolation of the latest available data.

#### Data on floppy disk

26. All quarterly series included in this publication are available in spreadsheet format on floppy disk (*Australian National Accounts: Quarterly Data on Floppy Disk* (5228.0)). These data generally run from September quarter 1959 for current price estimates and from September quarter 1974 for constant price estimates. The cost is currently \$90.00 per release (or \$350.00 for an annual subscription) for most customers. Order forms for the service can be obtained by telephoning (06) 252 6684.

#### Related publications

27. In addition to those mentioned above, other ABS publications which may be of interest include:

*Budget Related Paper No. 2, National Income and Expenditure* (5213.0) - issued annually

*Australian National Accounts: State Accounts* (5220.0) - issued annually

*Australian National Accounts: Capital Stock* (5221.0) - issued annually

*Australian National Accounts: Gross Product, Employment and Hours Worked* (5222.0) - issued quarterly

*Australian National Accounts: Financial Accounts* (5232.0) - issued quarterly

*Australian National Accounts: Multifactor Productivity* (5234.0) - issued annually

*A Guide to the Australian National Accounts* (5235.0)

28. Current publications produced by the ABS are listed in the *Catalogue of Publications and Products* (1101.0). The ABS also issues, on Tuesdays and Fridays, a *Publications Advice* (1105.0) which lists publications to be released in the next few days. The Catalogue and Publications Advice are available from any ABS office.

(a) Quarterly figures are derived from seasonally adjusted data. (b) Derived from data at average 1984-85 prices. (c) Annual ratios derived as simple averages of quarterly ratios. (d) Annual figures derived as sum of original quarterly figures.

## FEATURE ARTICLES IN PREVIOUS ISSUES OF THIS PUBLICATION

Article	Issue	Page reference
Measuring the nation's capital stock	Dec. qtr 1988	59
Imports of computer equipment	Mar. qtr 1989	59
Gross domestic product, employment and productivity 1982-83 and 1985-86	June qtr 1989	59
The flow of funds : Measuring the financial transactions of the Australian economy	Dec. qtr 1989	57
Natural resource and environmental accounting in the national accounts	Mar. qtr 1990	63
Which is the best short-term measure of gross domestic product?	June qtr 1990	57

## *For more information ...*

The ABS publishes a wide range of information on Australia's economic and social conditions. A catalogue of publications and products is available from any of our Offices (see below for contact details).

### **Information Consultancy Service**

Special tables or in-depth data investigations are provided by the ABS Information Consultancy Service in each of our Offices (see below for contact details).

### **Electronic Data Services**

A growing range of our data is available on electronic media. Selections of the most frequently requested data are available, updated daily, on DISCOVERY (Key \*656#). Our TELESTATS service delivers major economic indicator publications ready to download into your computer on the day of release. Our PC-AUSSTATS service enables on-line access to a data base of thousands of up-to-date time series. Selected datasets are also available on diskette or CD-ROM. For more details on our electronic data services, contact Information Services in any of our Offices on the numbers below.

### **Bookshops and Subscriptions**

There are over 500 titles available from the ABS Bookshops in each of our Offices. You can also receive any of our publications on a regular basis. Join our subscription mailing service and have your publications mailed to you in Australia at no additional cost. Telephone our Publications Subscription Service toll free on 008 02 06 08 Australia wide.
