CONTROLLER BUREAU OF CENSUS AND STATISTICS

CAMBERRA, AUSTRALIA

To be treated as strictly CONFIDENTIAL and NOT to be published, broadcast or cabled before 6 PAN, on FRIDAY 31 JULY 1970.

THE LABOUR FORCE, MAY 1970

Estimates of the civilian labour force are based on the results of the quarterly population survey, which is carried out on a one per cent sample throughout Australia in February, May, August and November each year. About 38,000 private dwellings (houses, flats, etc.) are visited during each survey, as well as a sample of other dwellings (hotels, motels, etc.). The survey information is obtained by means of personal interviews carried out by specially trained enumerators.

Population coverage

2. The sample used in the surveys covers the six States, the Northern Territory and the Australian Capital Territory. The estimates relate to all persons aged fifteen years and over, except members of the permanent armed forces, national servicemen enlisted in the Regular Army Supplement and certain diplomatic personnel customarily excluded from census and estimated populations.

Classification of the labour force

- 3. The labour force category to which a person is assigned depends on his actual activity (i.e. whether working, looking for work, etc.) during a specified week, known as "survey week", which is the week immediately preceding that in which the interview takes place. The interviews are carried out during a period of four weeks, so that there are four survey weeks in each of the months to which the survey relates. These survey weeks generally fall within the limits of the calendar month. The principal categories appearing in the tables in this bulletin are as follows:
 - (i) The labour force comprises all persons who, during survey week, were employed or unemployed as defined in (ii) and (iii) below.
 - (ii) Employed persons comprise all those who, during survey week,
 - (a) did any work for pay, profit, commission or payment in kind, in a job or business, or on a farm (including employees, employers and self-employed persons), or
 - (b) worked fifteen hours or more without pay in a family business (or farm), or
 - (c) had a job, business or farm, but were not at work because of illness, accident, leave, holiday or industrial dispute; or because of production hold-up due to bad weather, plant breakdown, etc.

A person who had a job but was temporarily laid off by his employer for the whole week without pay is excluded, and is classified in the tables as unemployed. A person who did some work during the week, however, before he either lost his job or was laid off, is classified as employed. A person who held more than one job is counted only once, in the job at which he worked most hours during survey week.

- (iii) Unemployed persons comprise all those who, during survey week, did no work at all, and who either
 - (a) did not have a job or business and were actively looking for work (including those who stated that they would have looked for work if they had not been temporarily ill or believed no work was available, or had not already made definite arrangements to start work in a new job after survey week), or
 - (b) were laid off from their jobs without pay for the whole week.

A person who either lost his job or was laid off <u>during</u> survey week, but did some work at his job during that week, is classified as employed.

Reference No. 6.20

(iv) Persons not in the labour force are all those who, during survey week, were not in the categories "employed" or "unemployed" as defined. This category therefore includes persons without a job, business or farm who were not actively looking for work, and who, during survey week, were either keeping house (unpaid), attending school, university, etc., retired or voluntarily idle, permanently unable to work or inmates of institutions. A person who worked less than fifteen hours without pay in a family business during survey week is also classified as not in the labour force.

Reliability of the estimates

- 4. Since the estimates in this bulletin are based on a sample, they may differ from the figures that would have been obtained from a complete census using the same questionnaires and procedures. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample, and not the whole population, was enumerated. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained from a comparable complete enumeration, and about nineteen chances in twenty that the difference will be less than two standard errors.
- 5. Space does not allow for the separate indication of the standard errors of all estimates in this bulletin. A table of standard errors which is intended to be of general application is therefore given below (Table A). Standard errors of estimates of quarter-to-quarter change are given in Table B, and approximate standard errors of estimates of the total number of persons in Australia in each of the principal employment status categories, classified by sex only, in Table C.
- The standard errors in these tables are averages based on calculations for a limited number of surveys and are also averages over a wide range of labour force characteristics. These figures thus give not a precise measure but an indication of the magnitude of the standard error of any particular estimate for any particular survey. An example of the use of Table A is as follows: if the estimate obtained from the sample is 100,000 and the standard error is 3 per cent of the estimate, i.e. 3,000, there are about two chances in three that the true figure is within the range 97,000 to 103,000 and about nineteen chances in twenty that this figure is between 94,000 and 106,000.
- The quarter-to-quarter change in the level of an estimate is also subject to sampling variability. The standard error of the change will depend on the standard error of the level of the estimate, rather than on the change itself. Final estimates of standard errors of movement have not yet been calculated, but an indication of the magnitude of standard errors of quarter-to-quarter change is given in Table 8, below. The estimates of standard error of quarter-to-quarter change apply only to estimates of change between two consecutive quarters. Changes between corresponding quarters of consecutive years, or between two other non-consecutive quarters, will generally be subject to somewhat greater sampling variability than is indicated in the table below.

TABLE A
STANDARD ERRORS OF QUARTERLY ESTIMATES

TABLE B
STANDARD ERRORS OF ESTIMATES OF
QUARTER-TO-QUARTER CHANGE
(Persons)

4,000	4,300
5,000	4,700
6,000	5,000
7,000	5,200
8,000	5,300

TABLE C STANDARD ERRORS OF PRINCIPAL EMPLOYMENT STATUS CATEGORIES

	Approximate standard error of estimates								
Category	:	la!es	Females		Persons				
	'000	Per cent	'000	Per cent	1000	Per cent			
Employed -				,					
Agriculture	12	3, 2	3	6.3	14	3.2			
Other industries	8	0.3	10	0.7	.12	0.3			
Total	8	0.2	10	0.7	12	0.3			
Unemployed	2	C.1	2	5.7	. 3	4.4			
Labour force	7	0.2	1C	0.7	12	0.3			
Not in the labour force	7	1, 1.	10	0.4	12	0.4			

- 8. It should be noted that the standard errors of estimates relating to agricultural employment are generally somewhat higher than the standard errors of other estimates of the same magnitude. Estimates for females also tend to have higher standard errors relative to estimates of equivalent size for males in similar employment categories.
- 9. The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the denominator. Percentages quoted in this bulletin, and any other percentages calculated from rigures presented herein, have generally somewhat lower standard errors (proportionally) than have the estimates which form the numerators of the percentages, particularly where the percentages are large.
- 10. As the standard errors in Tables A and B show, the smaller the estimate the higher is the relative standard error. Very small estimates would thus be subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable uses. In the tables in this bulletin, estimates less than 4,000 have not been shown. Although figures for these small components can be derived by subtraction, they should not be regarded as reliable.
- 11. The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by interviewers and respondents. Inaccuracies of this kind are referred to as the non-sampling error, and they may occur in any enumeration, whether it be a full count or only a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers and efficient operating procedures.

Seasonally adjusted series

12. Seasonally adjusted estimates for selected labour force characteristics are included in this bulletin for the first time. (See Table 2.) The methods used in seasonally adjusting these statistics are explained in "Seasonally Adjusted Indicators, 1970" (Reference No. 1.10), issued on 29 June 1970.

Detailed estimates' for earlier periods

- 13. Only the principal statistics are published in this quarterly bulletin, and some details are given for the latest quarter only. A wider range of detailed estimates for each quarter from February 1964 to November 1968 was published in "The Labour Force, 1954 to 1963" (Reference No. 5.22), issued on 6 July 1970. Corresponding particulars for 1969 will be issued smortly.
- NOTE. Any discrepancies between totals and sums of components in tables are due to rounding.
