

Reference No. 11.6

RETAIL SALES OF GOODS : AUSTRALIA  
MONTH OF MAY 1973 (Provisional)

CS  
658-8705  
AUS for  
C  
A provisional estimate of the total value of retail sales in Australia (excluding motor vehicles, parts, petrol, etc.) for the month of May 1973 is shown in the table overleaf. Figures for some earlier months are also shown for purposes of comparison.

2. The provisional monthly estimates of retail sales are obtained from a sub-sample of establishments used to provide quarterly estimates of the value of retail sales. *The monthly sub-sample is comparatively small since it is designed to provide prompt estimates of the total value of retail sales (excluding motor vehicles, parts, petrol, etc.) without placing an undue burden on either the resources of the Bureau or upon retail establishments.*
3. As the provisional monthly estimates are derived from returns received from a sample of retail establishments they may differ somewhat from the results which would have been obtained from a comparable complete collection. A measure of the likely difference is given by the standard error of the estimate. There are about 2 chances in 3 that a sample estimate will differ from results which would be obtained from a comparable complete collection by less than 1 standard error and 19 chances in 20 that the difference would be less than 2 standard errors. If, for example, a sample gives an estimate of \$500 million and the standard error of this estimate is 1 per cent, i.e. \$5 million, then there are 2 chances in 3 that a comparable complete collection would give a figure within the range of \$495 million to \$505 million and 19 chances in 20 that the figure would be within the range of \$490 million to \$510 million.
4. The standard error of the provisional estimates of the total value of monthly retail sales (excluding motor vehicles, parts, petrol, etc.) is about 1.0 per cent. The standard error of the month-to-month movement of the provisional estimates of the value of retail sales is generally about 0.3 per cent of the current monthly estimate. For example, the movement in the value of retail sales between the months of April and May 1973 is shown by the original series in the table overleaf as an increase of \$98.0 million. The standard error of this movement is about 0.3 per cent of the May 1973 estimate, i.e. approximately \$3.0 million. Therefore there are 2 chances in 3 that the movement in the value of retail sales between April and May 1973 was between \$95.0 million and \$101.0 million, and 19 chances in 20 that it was between \$92.0 million and \$104.0 million. Expressed in another way the estimates show a *proportionate* movement in the value of retail sales between April and May 1973 of 10.9 per cent and this has a standard error of about 0.3 percentage points, i.e. there are 2 chances in 3 that the proportionate movement was between 10.6 per cent and 11.2 per cent and 19 chances in 20 that it was between 10.3 per cent and 11.5 per cent.
5. The provisional monthly estimates may also differ from those which would be obtained from a sample as large as that used to provide quarterly estimates. Hence, the sum of the provisional estimates for the three months comprising a quarter may differ from the estimate obtained for that quarter from the full quarterly sample. The standard error of this difference is approximately 0.8 per cent of the quarterly estimate. The monthly estimates are subsequently adjusted in accordance with the quarterly estimates as they become available. However, for the December quarter of 1972 and for subsequent quarters a new quarterly sample based on the 1968-69 Retail Census replaced the old quarterly sample based on the 1961-62 Retail Census. As there were changes in scope and coverage between the two censuses and the quarterly samples based on them, it is not possible to adjust the estimates for the months of October 1972 to March 1973 inclusive which are based on the old quarterly sample, to the estimates for the December quarter of 1972 and the March quarter of 1973 which are based on the new sample. However, monthly estimates from April 1973 onward will be adjusted in accordance with the estimates from a new monthly sample and the new quarterly sample based on the 1968-69 Census results, when they become available.
6. Seasonally adjusted statistics are also shown in the table overleaf. In the seasonal adjustment, account has been taken of both normal seasonal factors and "trading-day" effects (arising from the varying numbers of Sundays, Mondays, Tuesdays, etc. in the month). While the normal seasonal factors should change only gradually from year to year the trading-day adjustment for any month will vary from year to year in accordance with the combination of days which occur in the month. Adjustment has also been made for the effects of movement in the date of Easter and Australia Day. However, as the series has been compiled only since April 1961 these adjustments are based necessarily on limited data and could be subject to revision when data for further years become available. It should be noted that the seasonally adjusted figures reflect the sampling errors to which the original figures are subject. Revised seasonally adjusted statistics are shown in this issue, following the annual re-analysis, details of which are shown in *Seasonally Adjusted Indicators 1973* (Reference No. 1.10) to be issued shortly. The revised adjustments are based on further observations of original data and consequently may differ somewhat in particular months from earlier estimates based on less recent data.
7. All figures in this bulletin are on a basis comparable with the 1961-62 Retail Census. Further information relating to the basis on which the statistics of retail sales of goods are compiled is contained in the quarterly bulletin *Retail Sales of Goods* (Reference No. 11.4) December quarter 1972 of 29 June 1973.
